# Introduction to JavaScript

1. JS in Console
2. DOM Manipulation
3. Chrome Extensions
4. What is a Programming Language?
5. What is Syntax?
6. HTML/CSS/JavaScript

# 1. JS in Console (Inspect)

1. Allows real-time editing of HTML/CSS/JS
2. Run Scripts: Test code in console.
3. Debug: Locate and fix errors.
4. Modify DOM: Change webpage elements.  
Errors: View error messages.

# 1. JS in Console (Alert)

A screenshot of a Google search results page. A large, semi-transparent watermark reading "ACKNOWLEDGED" is overlaid across the center. At the top, there's a message box from the browser console: "www.google.com says JavaScript is Magical". Below it, an "OK" button is visible. On the right side of the screen, the developer tools are open, showing the "Sources" tab selected. In the bottom right corner of the developer tools, the text "No Issues" is displayed. The main content area shows the Google homepage with the search bar containing "Google", the "I'm Feeling Lucky" button, and the "Google Search" button.

www.google.com says  
JavaScript is Magical

OK

Sources

Console >

No Issues

> alert('JavaScript is Magical');

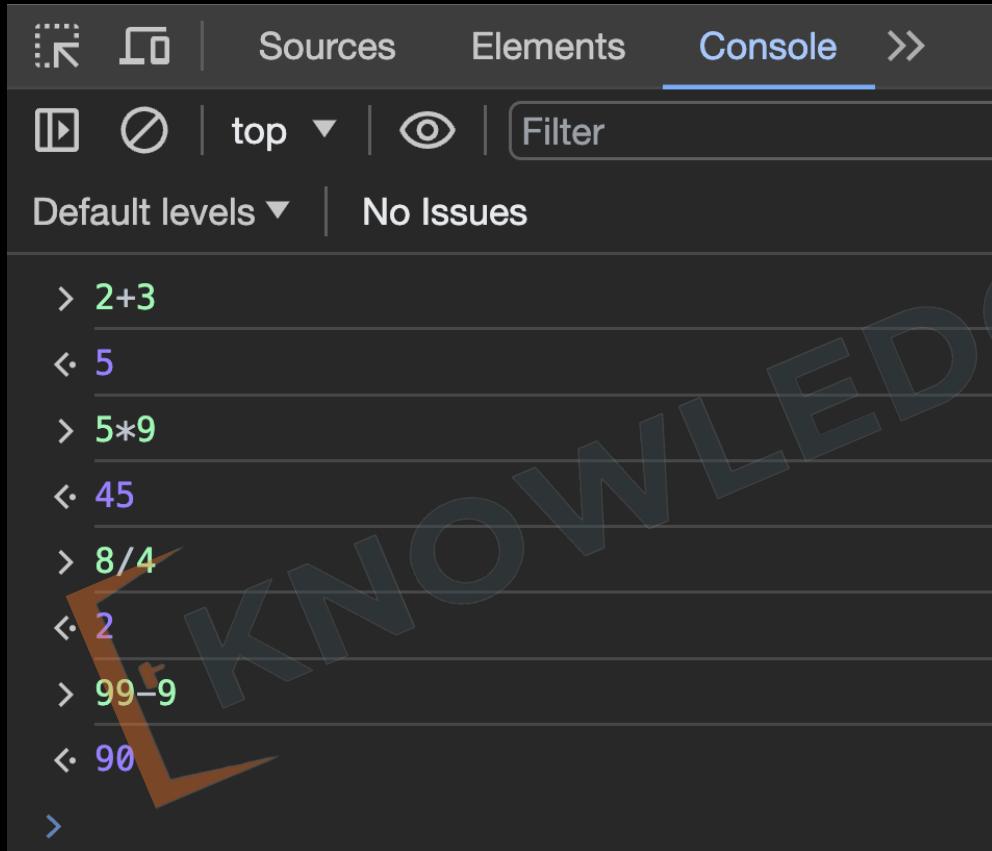

>

Default levels ▾

Google Search I'm Feeling Lucky

Google offered in: हिन्दी ବାଂଗ୍ଲା ତ୆ଲଗୁ ମରାଠୀ ତமିଳ் ଗୁଜରାଟି କନ୍ନଡ଼ ମଲଯାଳି ପଞ୍ଜାਬୀ

# 1. JS in Console (Math)

A screenshot of a browser's developer tools interface, specifically the Console tab. The tab bar includes 'Sources', 'Elements', 'Console' (which is underlined in blue), and '>>'. Below the tab bar are icons for play/pause, stop, top, and filter, followed by 'Default levels ▾' and 'No Issues'. The console area contains the following history of calculations:

- >  $2+3$
- < 5
- >  $5*9$
- < 45
- >  $8/4$
- < 2
- >  $99-9$
- < 90
- >

Console can be used  
as a Calculator

# 2. DOM Manipulation

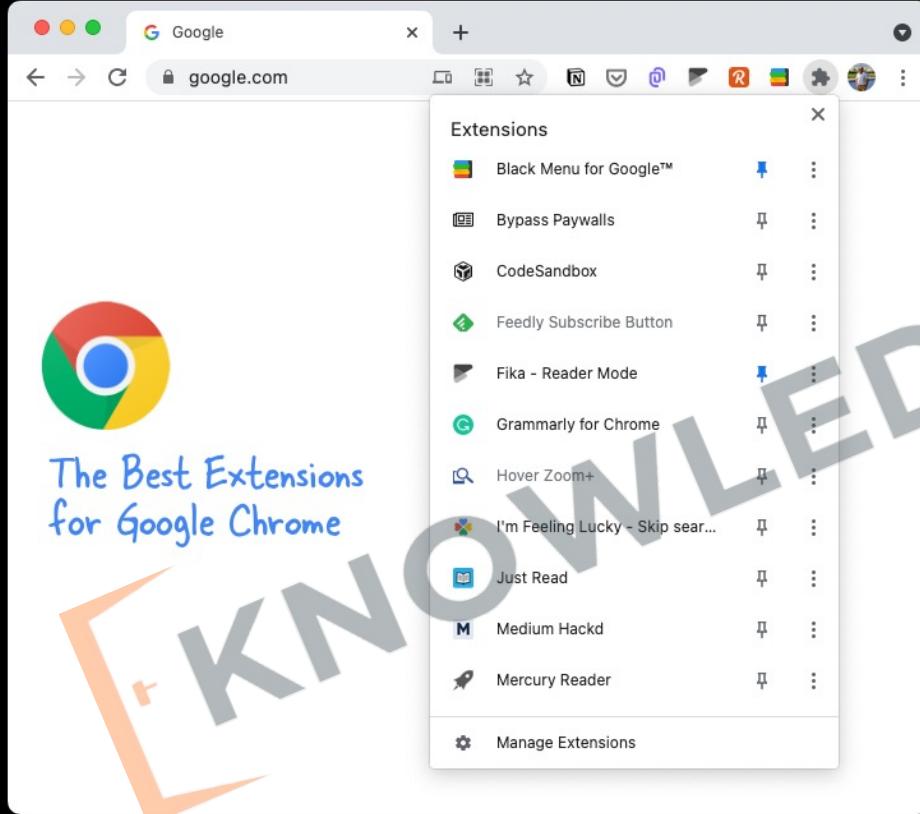

A screenshot of a browser window showing the developer tools console tab selected. The page content is "Welcome to KG Coding". The console output shows two lines of JavaScript code: changing the innerHTML of the body to a bolded version, and then setting the font size of the first bold element to 40px.

```
> document.body.innerHTML = '<b>Welcome to KG Coding</b>'  
< ' <b>Welcome to KG Coding</b>'  
> document.getElementsByTagName('b')[0].style.fontSize = '40px'  
< '40px'
```

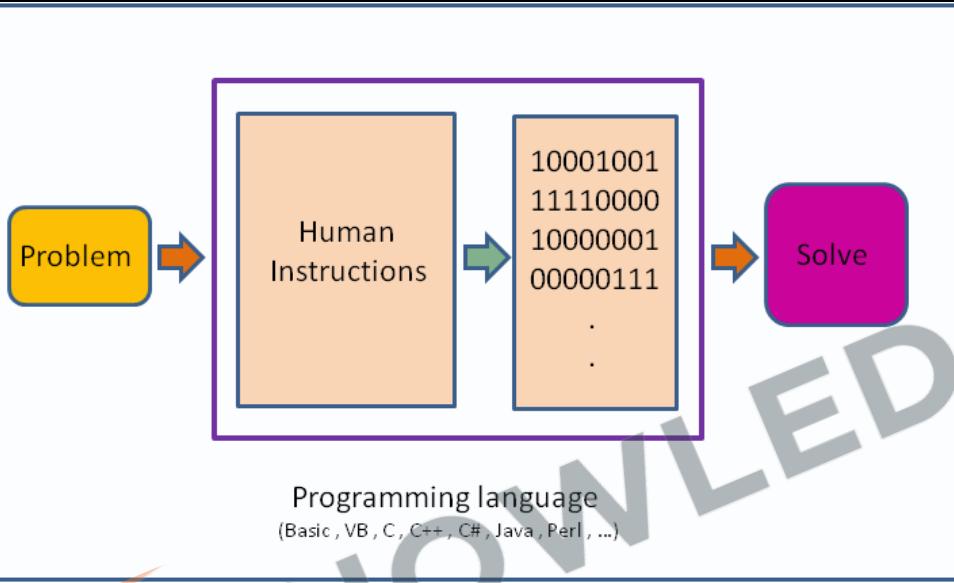

1. Change **HTML**
2. Change **CSS**
3. Perform **Actions**

# 3. Chrome Extensions

1. Create Features: Add new functionalities to Chrome.
2. Interact with Web: Modify or read webpage content.
3. API Access: Use Chrome's built-in functions.
4. User Experience: Enhance or customize browsing.

# 4. What is a Programming Language?

- Giving instructions to a computer
- **Instructions:** Tells computer what to do.
- These instructions are called **code**.

# 5. What is a Syntax?

- Structure of words in a sentence.
- Rules of the language.
- For programming exact syntax must be followed.

```
> alert 'hello world'  
✖ Uncaught SyntaxError: Unexpected string  
> |
```

# 6. FrontEnd / BackEnd / FullStack

Client Side / Front-End  
Web Development

Server Side  
Back-End

Full Stack

# 6. Role of Browser

1. **Displays Web Page:** Turns HTML code into what you see on screen.
2. **User Clicks:** Helps you interact with the web page.
3. **Updates Content:** Allows changes to the page using JavaScript.
4. **Loads Files:** Gets HTML, images, etc., from the server.

# 6. HTML

(Hypertext Markup Language)

1. **Structure:** Sets up the layout.
2. **Content:** Adds text, images, links.
3. **Tags:** Uses elements like `<p>`, `<a>`.
4. **Hierarchy:** Organizes elements in a tree.

HTML is required for JavaScript

# 6. JS

(Java Script)

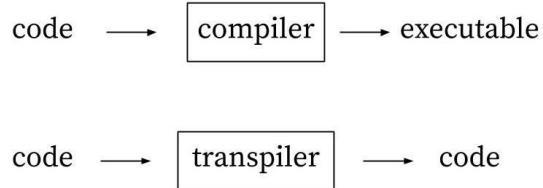

1. JavaScript has nothing to do with Java
2. Actions: Enables interactivity.
3. Updates: Alters page without reloading.
4. Events: Responds to user actions.
5. Data: Fetches and sends info to server.

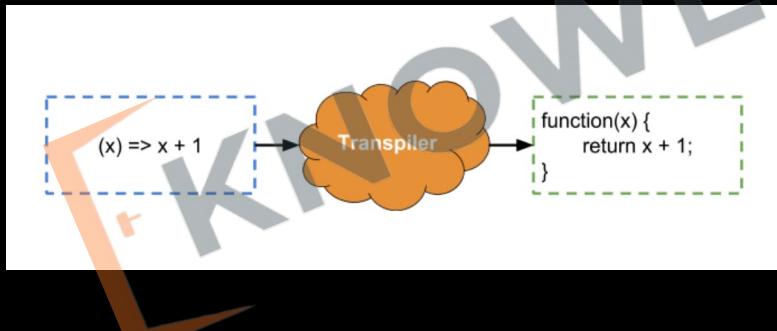

# 6. JS

## (Java Script)

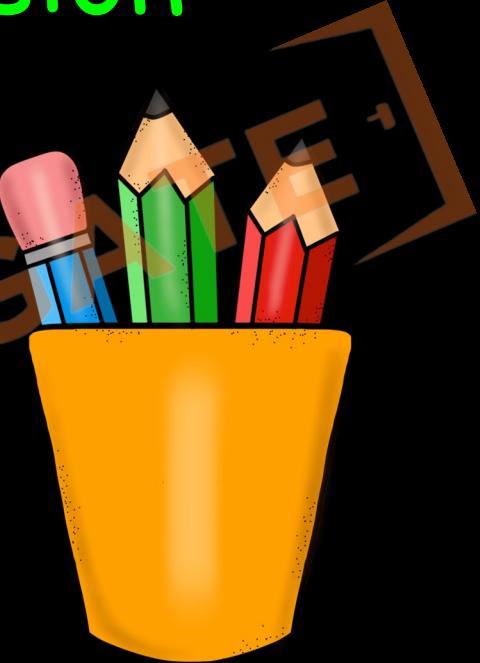

1. JavaScript runs at the client side in the browser.
2. Coffee Script / TypeScript are transpiled to JavaScript.

# Introduction Revision

1. JS in Console
2. DOM Manipulation
3. Chrome Extensions
4. What is a Programming Language?
5. What is Syntax?
6. HTML/CSS/JavaScript

# Practice Exercise

## Introduction

1. Use an **alert** to display Good Morning.
2. **Display** your name in a **popup**.
3. Using Math calculate the following:  
=> 75-25  
=> 3+3-5
4. Change **Facebook** page to display “I am Learning JS”

PLACE ORDER

# 9. Types of Numbers (Integers & Floats)

# 9. Types of Numbers (Float Problems)

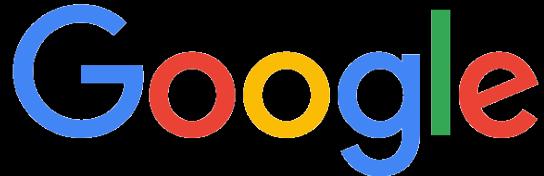

A screenshot of a browser's developer tools console. The top navigation bar shows 'Sources' and 'Elements'. Below the toolbar, there are icons for play, stop, and filter, with 'top' selected. The console output shows the following:

```
> 0.1+0.2
<- 0.3000000000000004
> 45.1 + 8.2
<- 53.3
> Math.round(53.3)
<- 53
> |
```

The output for `0.1+0.2` shows a significant loss of precision, returning `0.3000000000000004`. The output for `Math.round(53.3)` is `53`, demonstrating that floating-point numbers are not always rounded correctly.

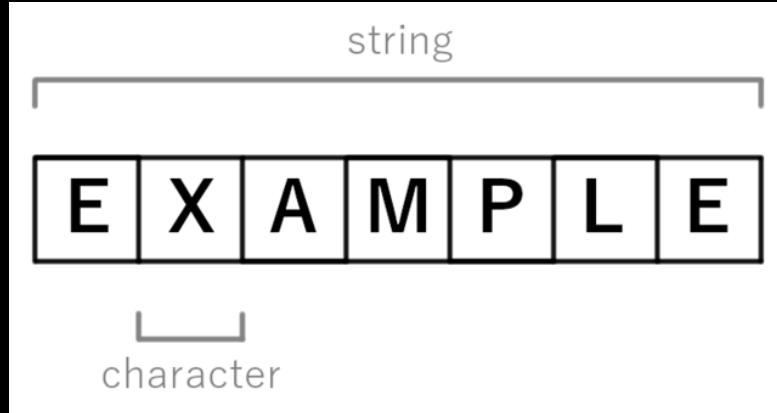

1. JavaScript has many problems with float operations.
2. We can use `Math.round()` to convert floats to integers.
3. Always do money calculation in Paisa instead of Rupees

# 10. Don't learn syntax.

1. **Google**: Quick answers to coding problems.
2. **MDN**: In-depth guides and documentation.  
<https://developer.mozilla.org/>
3. **ChatGPT**: Real-time assistance for coding queries.
4. **Focus**: Understand concepts, not just syntax.

# 11. Strings

1. Strings hold **textual data**, anything from a single character to paragraph.
2. Strings can be defined using **single quotes ''**, **double quotes " "**, or **backticks ``**. Backticks allow for template literals, which can include variables.
3. You can combine (**concatenate**) strings using the **+** operator. For example, **"Hello" + " World"** will produce **"Hello World"**.

# 12. Type Of Operator

JS

## typeof function

typeof 'this is a string'

'string'

typeof 12345

'number'

typeof (11 === 11)

'boolean'

1. **Check Type:** Tells you the data type of a variable.
2. **Syntax:** Use it like `typeof` variable.
3. **Common Types:** Returns "number," "string," "boolean," etc.

# Numbers & Strings Revision

7. Arithmetic Operators
8. Order of Operations
9. Types of Numbers
10. Don't learn syntax.
11. Strings
12. TypeOf Operator

# Practice Exercise

## Numbers & Strings

1. At a restaurant you ate: 1 Dal ₹ 100, 2 Roti ₹10 each, 1 Ice Cream ₹30, calculate and display the final bill amount.
2. Calculate 18% GST on iPhone15 ₹79,990 and 2 Air pods Pro ₹24990 each.
3. Create strings using all 3 methods.
4. Concatenate String with Strings, and String with numbers.
5. Create Order Summary String for our Myntra Cart.
6. Display order summary in a popup

# JavaScript with HTML & CSS

- 13. VS Code IDE
- 14. HTML Tags Introduction
- 15. CSS Introduction
- 16. Query Selector
- 17. Script Tag
- 18. Comments

# 13. What is IDE

1. IDE stands for Integrated Development Environment.
2. Software suite that consolidates basic tools required for software development.
3. Central hub for coding, finding problems, and testing.
4. Designed to improve developer efficiency.

# 13. Need of IDE

1. Streamlines development.
2. Increases productivity.
3. Simplifies complex tasks.
4. Offers a unified workspace.
5. IDE Features
  1. Code Autocomplete
  2. Syntax Highlighting
  3. Version Control
  4. Error Checking

```
MainActivity.kt
```

```
@Composable
fun MessageCard(msg: Message) {
    Row(modifier = Modifier.padding(all = 8.dp)) {
        Image(
            painter = painterResource(R.drawable.android_studio_logo),
            contentDescription = "Profile Picture",
            modifier = Modifier
                .size(45.dp)
        )
        Spacer(modifier = Modifier.width(8.dp))
        Column (Modifier
            .background(color = Color.White)) {
            Text(text = msg.author, color = Color.Black)
            Spacer(modifier = Modifier.height(1.dp))
            Text(text = msg.body, color = Color.Black)
        }
    }
}
```

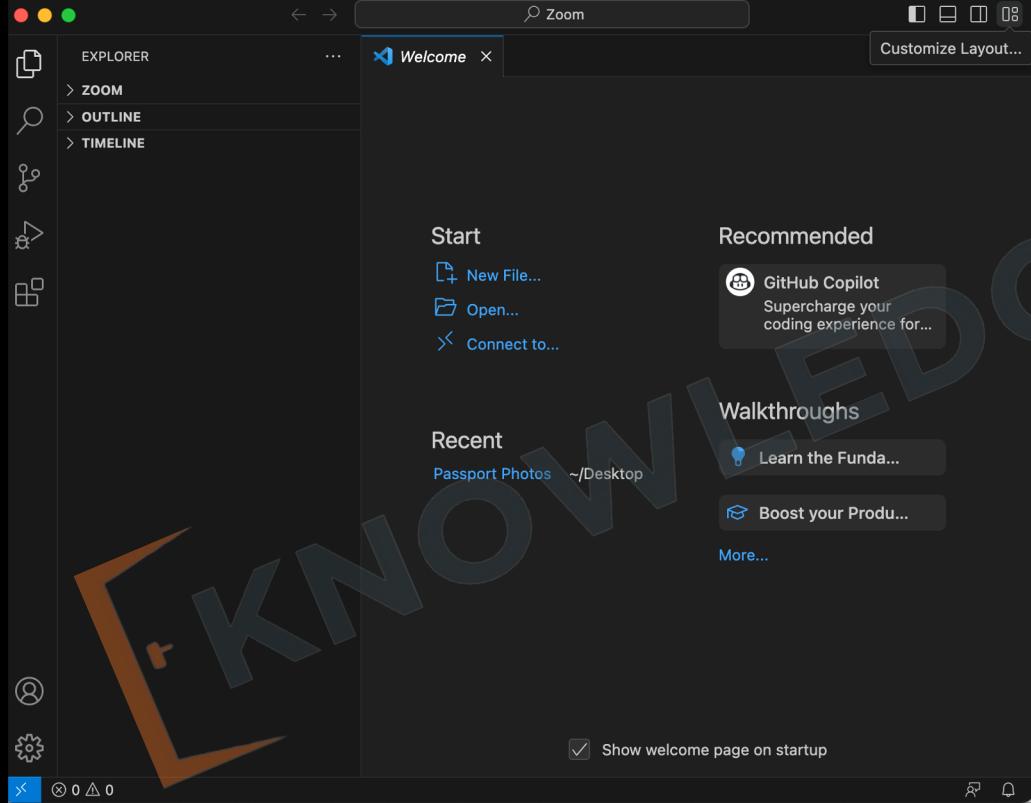

# 13. Installation & Setup

1. Search VS Code
2. Keep Your **Software** up to date

KNOWLEDGE GATE

# 13. Opening project in VsCode

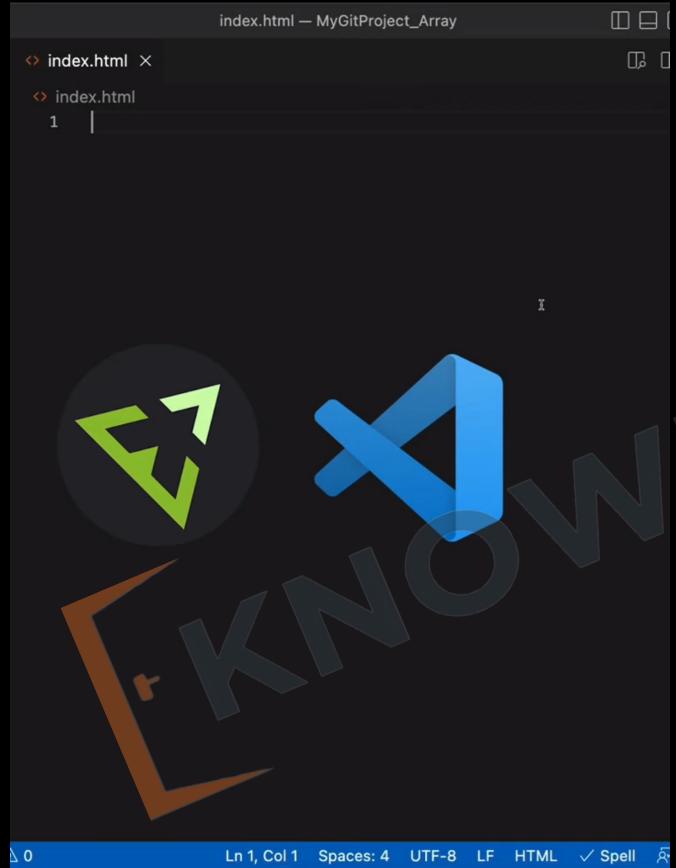

# 13. VsCode Extensions and Settings

1. Live Server
2. Prettier
3. Line Wrap
4. Tab Size from 4 to 2

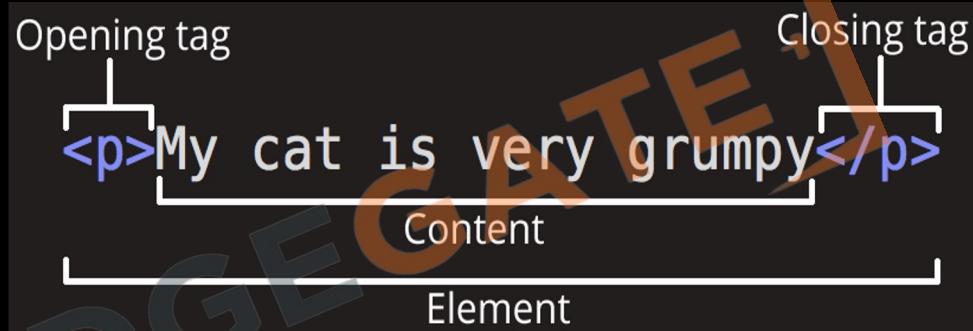

# 13. Using Emmet ! to generate code

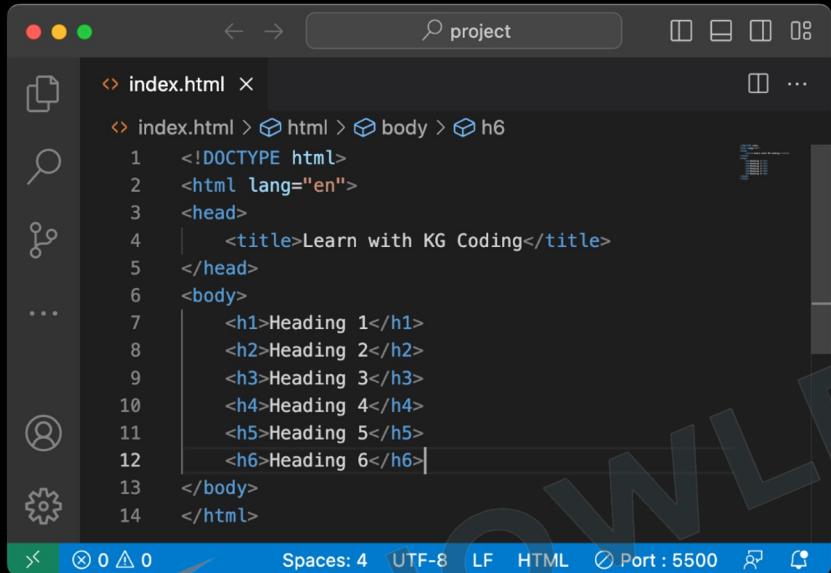

1. Type ! and wait for suggestions.

# 14 HTML Tags Introduction

1. Elements that are used to create a website are called HTML Tags.
2. Tags can contain content or other HTML tags.
3. Define elements like text, images, links

# 14 Heading Tag

A screenshot of a code editor window titled "index.html". The code displays a simple HTML structure with headings:

```
<!DOCTYPE html>
<html lang="en">
<head>
    <title>Learn with KG Coding</title>
</head>
<body>
    <h1>Heading 1</h1>
    <h2>Heading 2</h2>
    <h3>Heading 3</h3>
    <h4>Heading 4</h4>
    <h5>Heading 5</h5>
    <h6>Heading 6</h6>
</body>
</html>
```

The editor interface includes a sidebar with icons for file, search, and user, and a bottom status bar showing "Spaces: 4", "UTF-8", "LF", "HTML", and "Port : 5500".

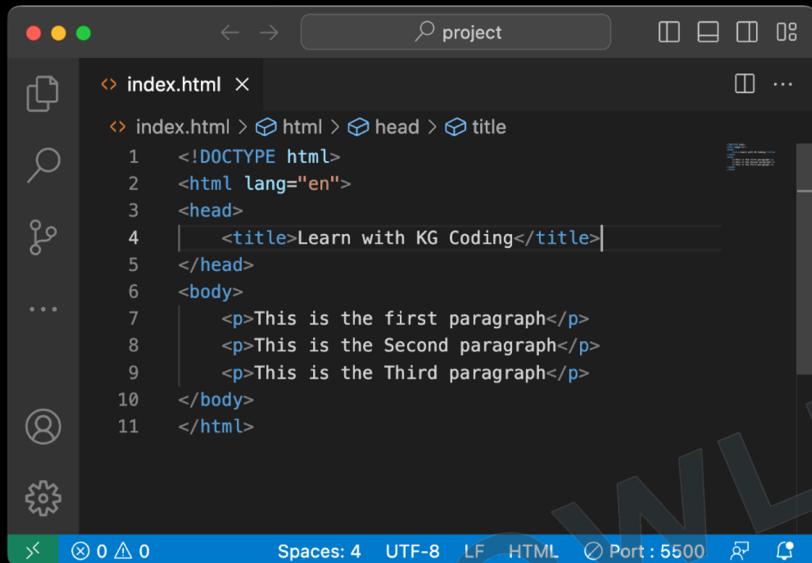

1. Defines **headings** in a document
2. Ranges from **<h1>** to **<h6>**
3. **<h1>** is most important, **<h6>** is least
4. Important for **SEO**
5. Helps in structuring content

# 14 Button tag

```
Button.html — testing
Button.html •
1 <!DOCTYPE html>
2 <html lang="en">
3 <head>
4     <title>Button</title>
5     <style>
6         button {
7             margin: 10px;
8         }
9         .blue {
10             background-color: blue;
11             color: red;
12         }
13         .wow {
14             background-color: #4CAF50;
15             border: none;
16             border-radius: 10px;
17             color: white;
18             padding: 8px 10px;
19         }
20     </style>
21 </head>
22 <body>
23     <button>Click Me</button> <br>
24     <button class="blue">Blue button</button> <br>
25     <button class="wow">Sundar button</button>
26 </body>
27 </html>
```

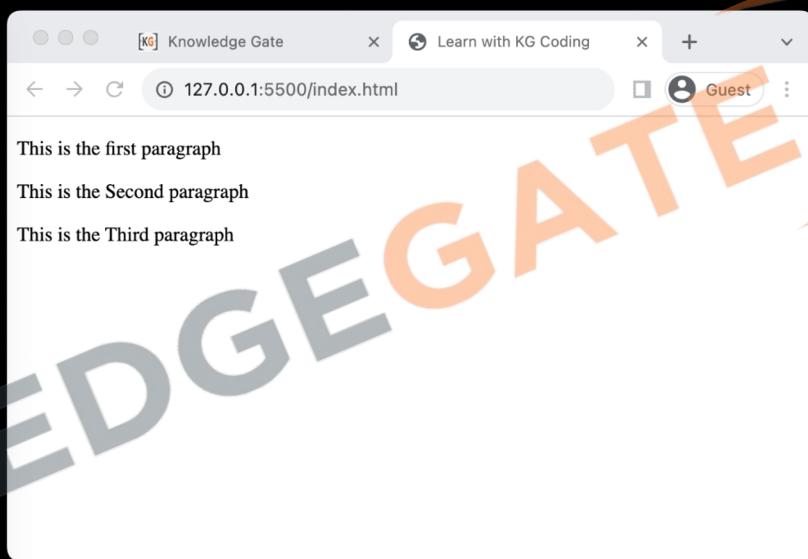

# 14 Paragraph Tag

A screenshot of a code editor window titled "project". The file "index.html" is open, showing the following code:

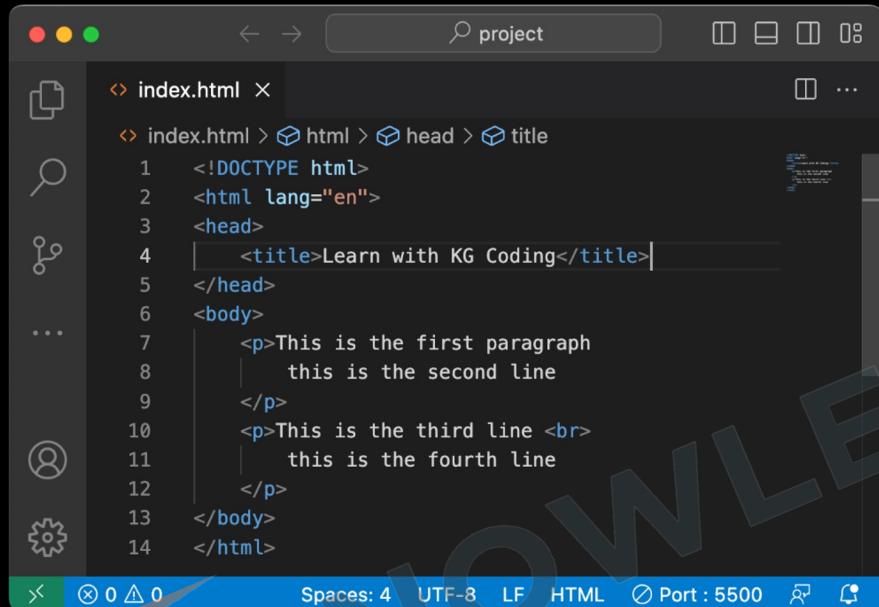

```
<!DOCTYPE html>
<html lang="en">
<head>
    <title>Learn with KG Coding</title>
</head>
<body>
    <p>This is the first paragraph</p>
    <p>This is the Second paragraph</p>
    <p>This is the Third paragraph</p>
</body>
</html>
```

The code editor has a dark theme with light-colored syntax highlighting. A sidebar on the left contains icons for file operations like new, open, save, and delete.

1. Used for defining **paragraphs**
2. Enclosed within **<p>** and **</p>** tags
3. Adds **automatic spacing** before and after
4. **Text wraps** to next line inside tag
5. Common in **text-heavy content**

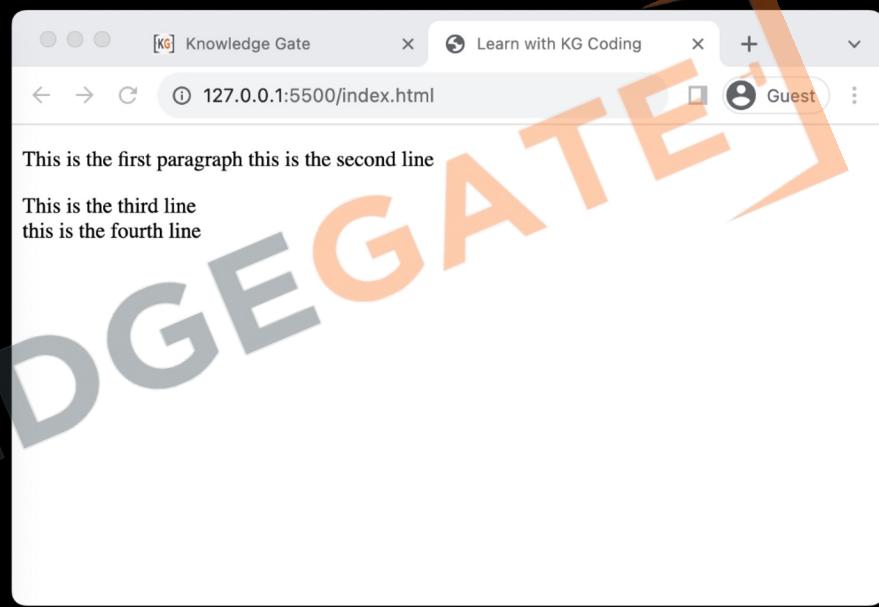

# 14 <BR> Tag

A screenshot of a code editor window titled "index.html". The code is as follows:

```
<!DOCTYPE html>
<html lang="en">
<head>
    <title>Learn with KG Coding</title>
</head>
<body>
    <p>This is the first paragraph<br/>
        this is the second line</p>
    <p>This is the third line <br>
        this is the fourth line</p>
</body>
</html>
```

The code editor has a dark theme with light-colored syntax highlighting. The status bar at the bottom shows "Spaces: 4", "UTF-8", "LF", "HTML", and "Port : 5500".

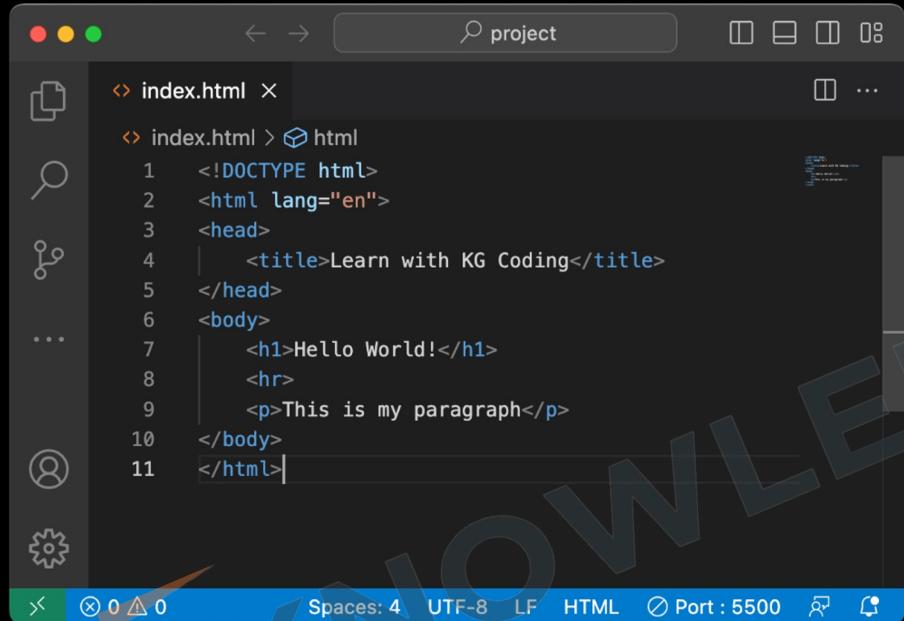

A screenshot of a web browser window titled "Knowledge Gate". The URL is "127.0.0.1:5500/index.html". The page content is:

This is the first paragraph this is the second line  
This is the third line  
this is the fourth line

A large, semi-transparent watermark reading "KNOWLEDGE GATE" is overlaid across the bottom of the browser window.

1. <br> adds a **line break** within text
2. <br> is empty, no closing tag needed
3. <br> and <br /> are both valid

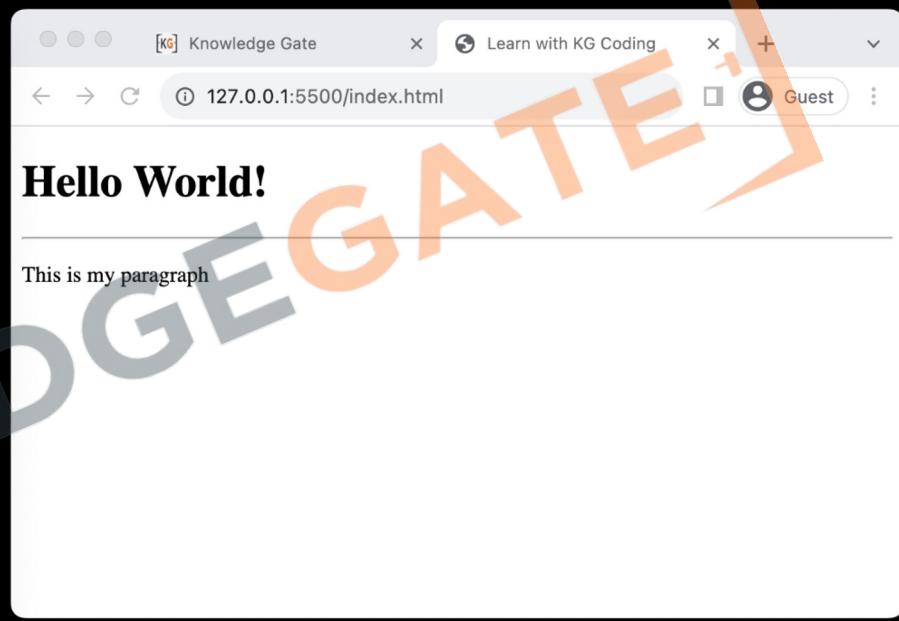

# 14 <HR> Tag

A screenshot of a code editor window titled "index.html". The code is as follows:

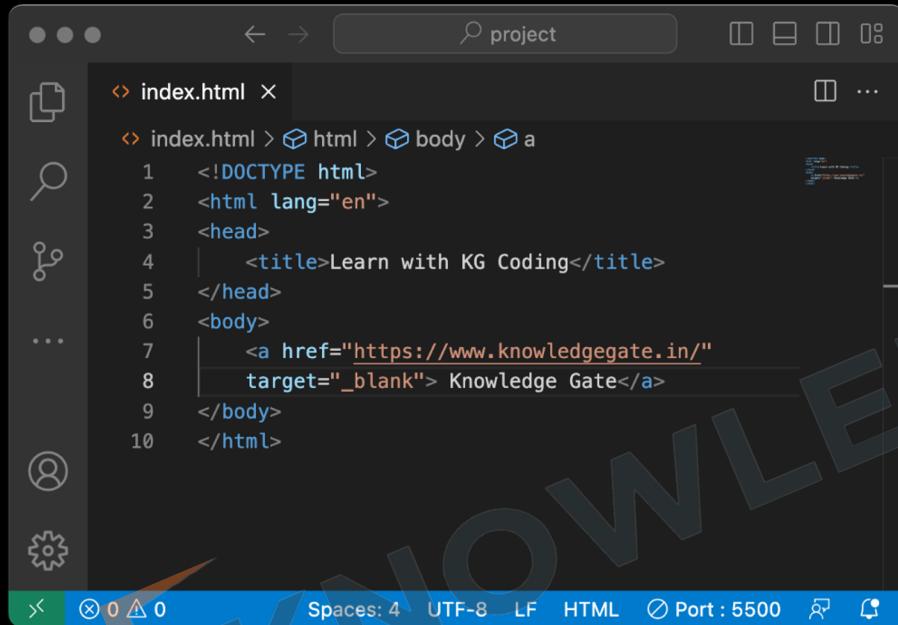

```
<!DOCTYPE html>
<html lang="en">
<head>
    <title>Learn with KG Coding</title>
</head>
<body>
    <h1>Hello World!</h1>
    <hr>
    <p>This is my paragraph</p>
</body>
</html>
```

The code editor has a dark theme with light-colored text. It includes a sidebar with various icons for file operations like copy, paste, search, and refresh. At the bottom, there are buttons for file operations (New, Open, Save, etc.) and settings.

1. <hr> creates a horizontal rule or line
2. <hr> also empty, acts as a divider

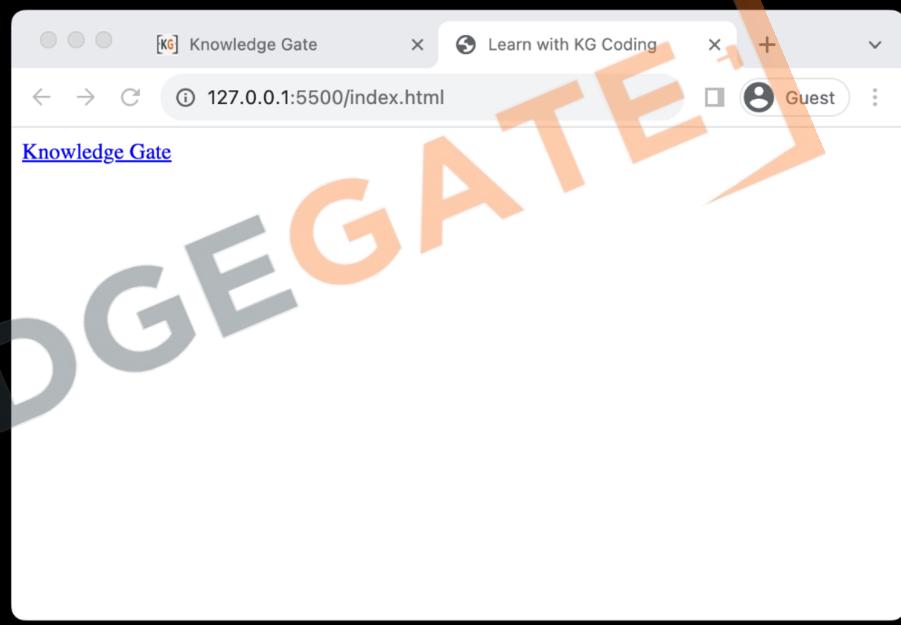

# 14 Anchor Tag

A screenshot of a code editor window titled "project". The file "index.html" is open, showing the following HTML code:

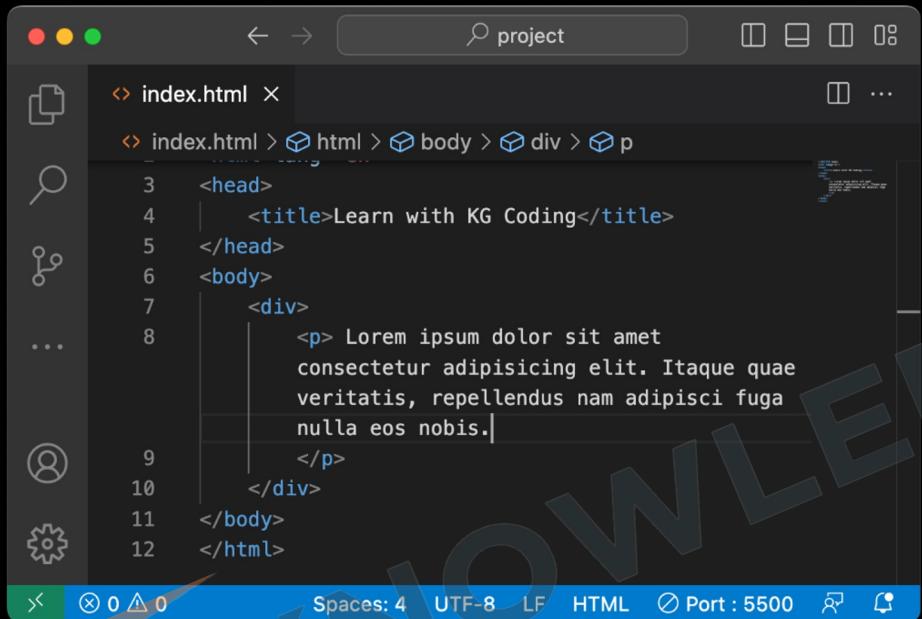

```
<!DOCTYPE html>
<html lang="en">
<head>
    <title>Learn with KG Coding</title>
</head>
<body>
    <a href="https://www.knowledgegate.in/" target="_blank"> Knowledge Gate</a>
</body>
</html>
```

The line containing the anchor tag is highlighted.

1. Used for creating **hyperlinks**
2. Requires **href** attribute for URL
3. Can link to external sites or internal pages
4. Supports **target** attribute to control link behavior

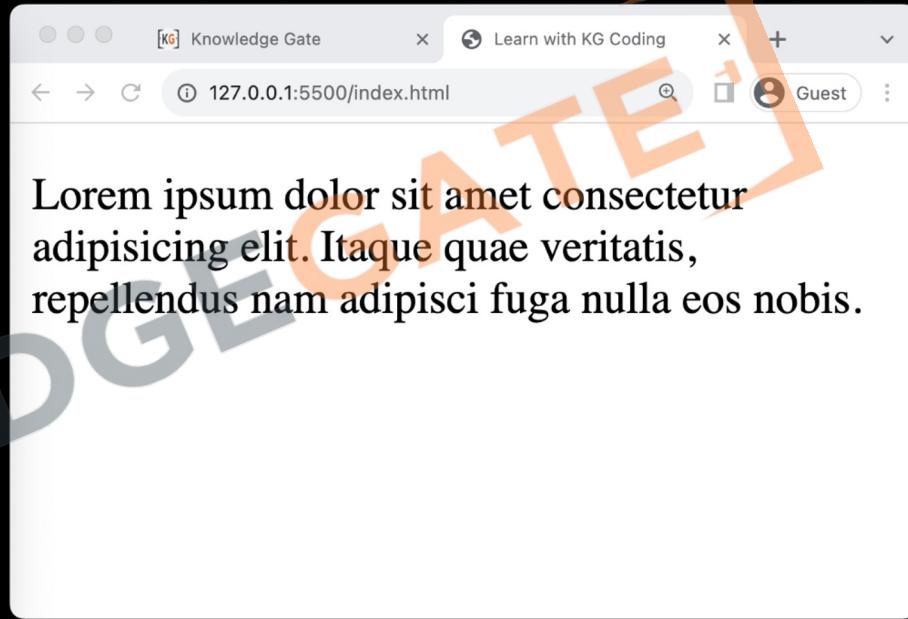

# 14 Div Tags

A screenshot of a code editor window titled "project". The file "index.html" is open, showing the following HTML code:

```
<head>
  <title>Learn with KG Coding</title>
</head>
<body>
  <div>
    <p> Lorem ipsum dolor sit amet
      consectetur adipisicing elit. Itaque quae veritatis,
      repellendus nam adipisci fuga nulla eos nobis.
    </p>
  </div>
</body>
</html>
```

The code editor has a dark theme with orange icons. A search bar at the top contains the text "project". The status bar at the bottom shows "Spaces: 4", "UTF-8", "LF", "HTML", "Port : 5500", and a refresh icon.

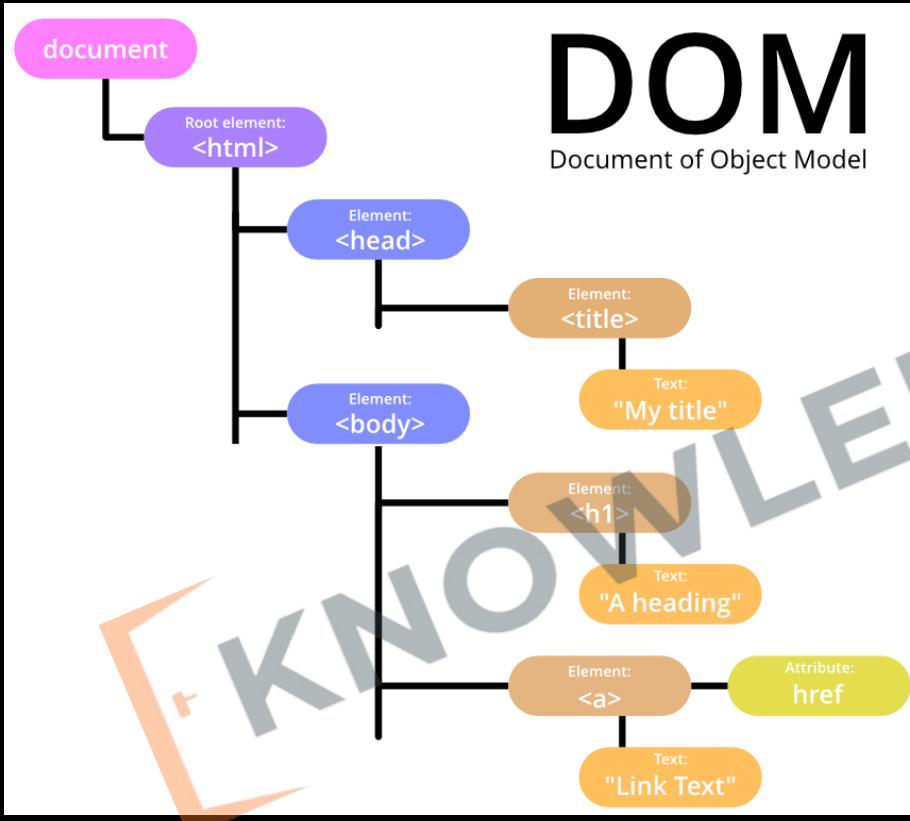

1. **Purpose:** Acts as a container for other **HTML** elements.
2. **Non-Semantic:** Doesn't provide inherent meaning to enclosed content.
3. **Styling:** Commonly used for layout and styling via **CSS**.
4. **Flexibility:** Highly versatile and can be customized using classes or IDs.

# 14 Basic HTML Page

```
<!DOCTYPE html>           Defines the HTML Version  
  
<html lang="en">          Parent of all HTML tags / Root element  
  
    <head>                Parent of meta data tags  
        <title>My First Webpage</title>  Title of the web page  
    </head>  
  
    <body>                Parent of content tags  
        <h1>Hello World!</h1>  Heading tag  
    </body>  
  
</html>
```

# 14 HTML DOM

- 1. Structure Understanding:** Helps in understanding the **hierarchical structure** of a webpage, crucial for applying targeted CSS styles.
- 2. Dynamic Styling:** Enables learning about dynamic styling, allowing for **real-time changes** and interactivity through CSS.

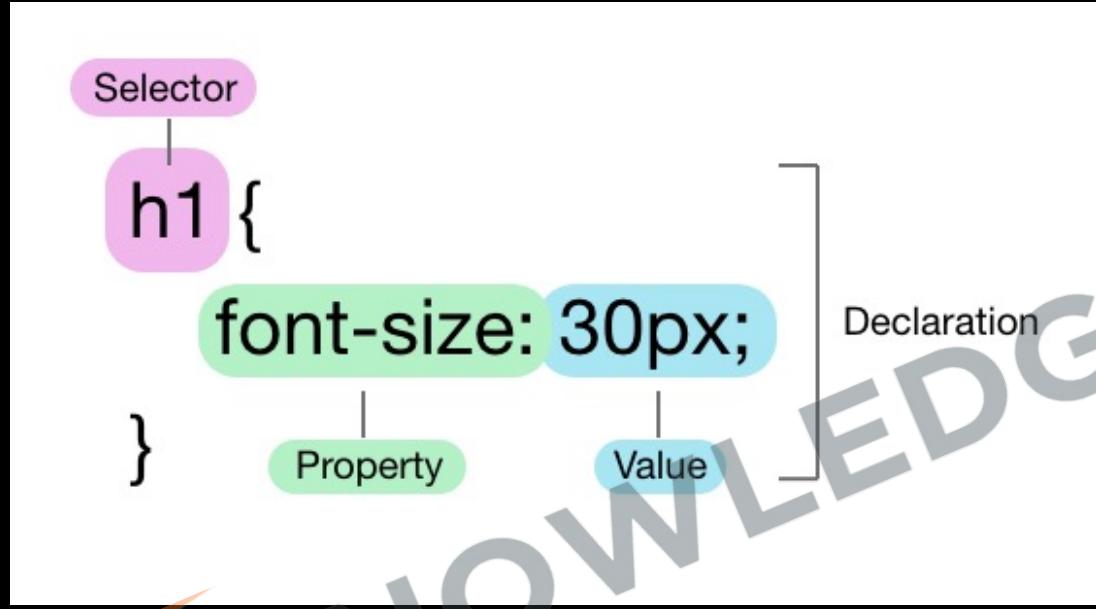

# 14 HTML (Attributes)

## Html Attributes

1. Provides additional information about elements
2. Placed within opening tags
3. Common examples: href, src, alt
4. Use name=value format
5. Can be single or multiple per element

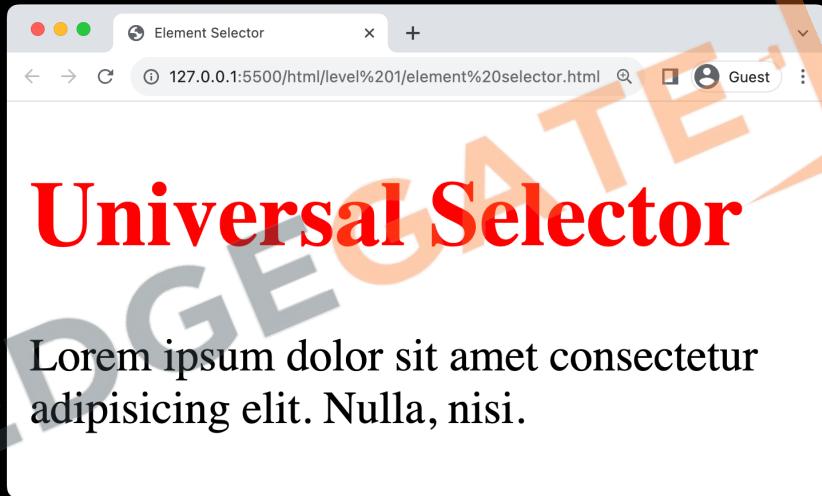

# 15 CSS (Basic Syntax)

- **Selector:** The HTML element that you want to style.
- **Property:** The attribute you want to change (like font, color, etc.).
- **Value:** The specific style you want to apply to the property (like red, bold, etc.).

# 15 CSS (Element selector)

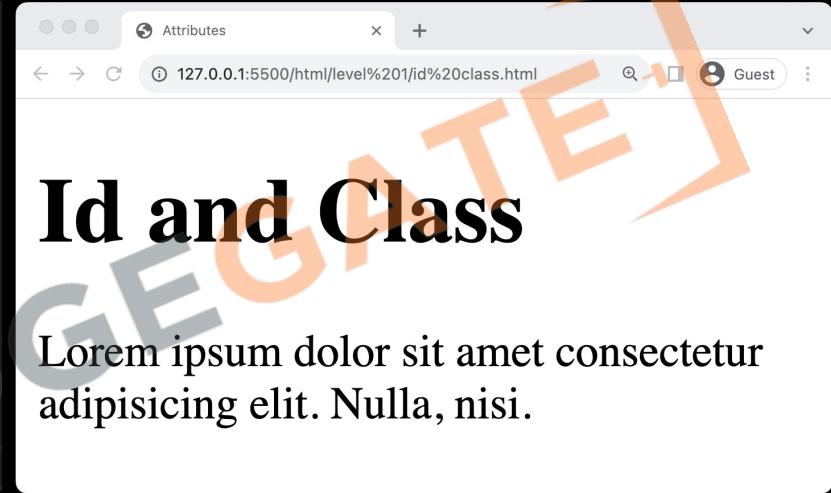

```
3 <head>
4     <title>Element Selector</title>
5     <style>
6         h1 {
7             color: red
8         }
9     </style>
10    </head>
11    <body>
12        <h1>Universal Selector</h1>
13        <p>Lorem ipsum dolor sit amet consectetur
14           adipisicing elit. Nulla, nisi.</p>
```

- **Targets Elements:** Selects HTML elements based on their **tag name**.
- **Syntax:** Simply use the **element's name**
- **Uniform Styling:** Helps in applying **consistent styles** to all instances.
- **Ease of Use:** Straightforward and **easy** to implement for basic styling.

# 15 CSS (id & class attribute)

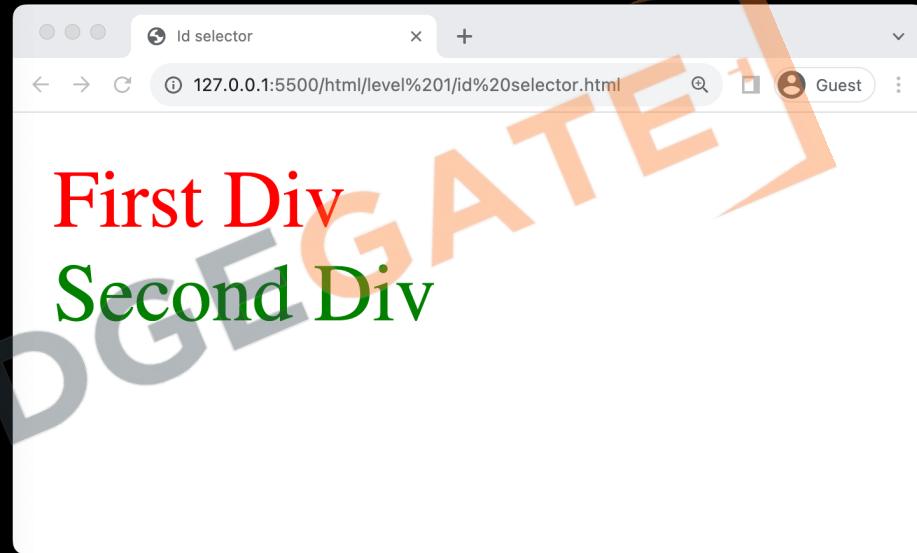

```
1  <!DOCTYPE html>
2  <html lang="en">
3  <head>
4  |   <title>Attributes</title>
5  </head>
6  <body>
7  |   <h1 id="top_heading">Id and Class</h1>
8  |   <p class="article">Lorem ipsum dolor sit amet
9   |       consectetur adipisicing elit. Nulla, nisi.</p>
9  </body>
10 </html>
```

- **ID Property:** Assigns a unique identifier to a single HTML element.
- **Class Property:** Allows grouping of multiple HTML elements to style them collectively.
- **Reusable Classes:** Class properties can be reused across different elements for consistent styling.
- **Specificity and Targeting:** Both properties assist in targeting specific elements or groups of elements for precise styling.

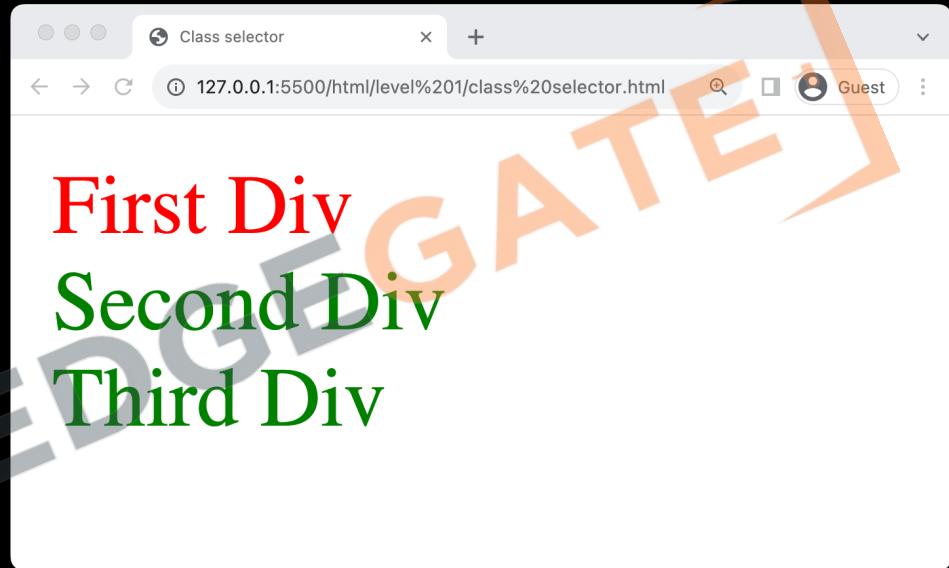

# 15 CSS (Id selector)

```
3 <head>
4     <title>Id selector</title>
5     <style>
6         #first { color: red; }
7         #second { color: green; }
8     </style>
9 </head>
10 <body>
11     <div id="first">First Div</div>
12     <div id="second">Second Div</div>
13 </body>
```

# 15 CSS (Class selector)

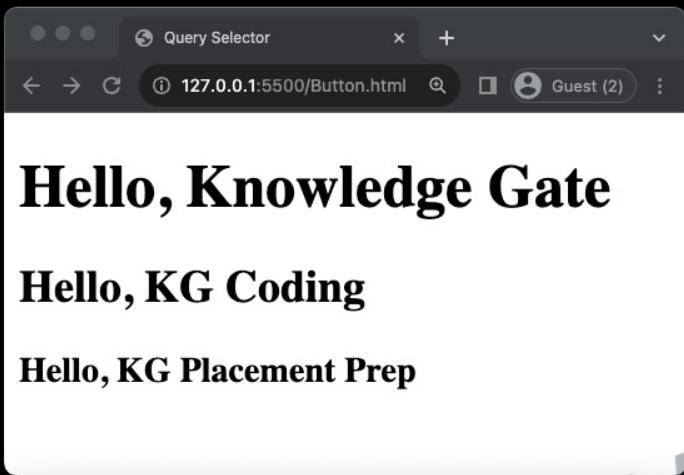

```
<head>
    <title>Class selector</title>
    <style>
        #first { color: red; }
        .second { color: green; }
    </style>
</head>
<body>
    <div id="first">First Div</div>
    <div class="second">Second Div</div>
    <div class="second">Third Div</div>
</body>
```

# 16 Query Selector

1. **getElementById**: Finds one element by its ID.
2. **getElementsByClassName**: Finds elements by their class, returns a list.
3. **querySelector**: Finds the first element that matches a CSS selector.
4. **Purpose**: To interact with or modify webpage elements.

# 16 Query Selector

Button.html – testing

```
<!DOCTYPE html>
<html lang="en">
<head>
<title>Query Selector</title>
</head>
<body>
<h1>Hello, Knowledge Gate</h1>
<h2 class="coding">Hello, KG Coding</h2>
<h3 id="placement">Hello, KG Placement Prep</h3>
</body>
</html>
```

hello students

Hello, KG Coding

Hello, KG Placement Prep

No Issues

```
> const hElement = document.querySelector('h1');
const hElementCode = document.querySelector('.coding');
const hElementPlacement =
document.querySelector('#placement');

hElement.textContent = 'hello students';
hElementCode.style.color = 'red';

<- 'red'

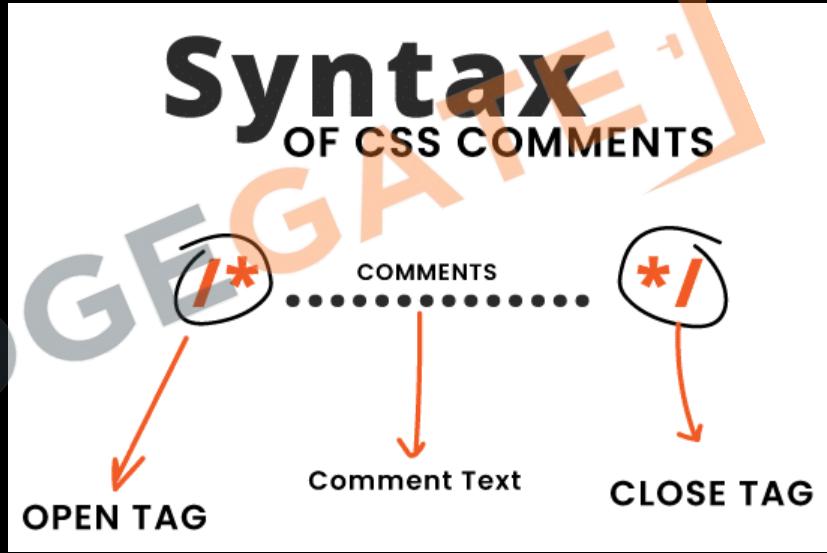

>
```

# 17 Script Tag

1. Embed Code: Incorporates JavaScript into an HTML file, either directly or via external files.
2. Placement: Commonly placed in the `<head>` or just before the closing `</body>` tag to control when the script runs.
3. External Files: Use `src` attribute to link external JavaScript files, like `<script src="script.js"></script>`.
4. Console Methods: `log`, `warn`, `error`, `clear`

# 18 JavaScript & CSS Comments

1. Used to add notes in source code in JavaScript or CSS.
2. Not displayed on the web page
3. Syntax: `/* comment here */`
4. Helpful for code organization
5. Can be multi-line or single-line

# 18 HTML Comments

1. Used to add **notes** in HTML code
2. **Not displayed** on the web page
3. Syntax: `<!-- Comment here -->`
4. Helpful for **code organization**
5. Can be **multi-line** or **single-line**

Writing comments in HTML

Single-line  
Comment

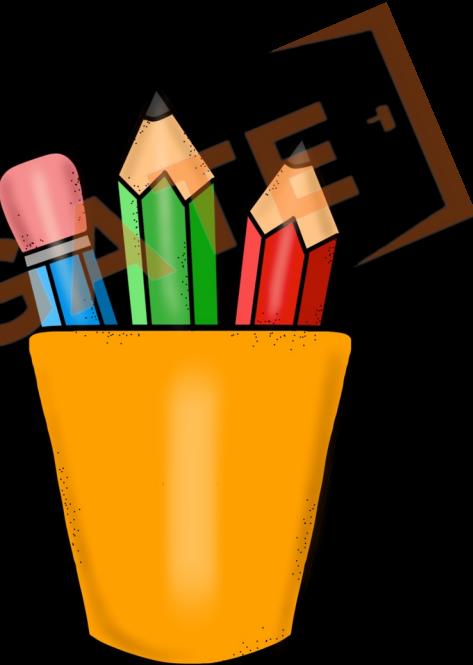

```
1 <!--This is a single line  
comment in HTML. You cannot  
see it on a webpage. Click  
on view-source to see a  
message I left just for you.  
-->
```

Multi-line  
Comment

```
1 <!-- This is a multi-line  
comment in HTML.  
2 You cannot see it on a  
webpage.  
3 If you view-source on the  
browser you can see the  
comment there.-->
```

# JavaScript with HTML & CSS Revision

- 13. VS Code IDE
- 14. HTML Tags Introduction
- 15. CSS Introduction
- 16. Query Selector
- 17. Script Tag
- 18. Comments

# Practice Exercise

## JavaScript With HTML & CSS

1. Create a **button** with text click
2. Create 2 buttons with **class** and **id**
3. Create a **paragraph**
4. Add **colors** to two buttons
5. Add proper html **structure**
6. Change page **title**
7. Try to copy the given design on the bottom

8. Add script element to page to **show welcome alert**
9. Add onclick alert on **Add to Bag** and **Heart Wishlist** buttons

# Variables

19. What are Variables
20. Syntax Rules
21. Updating Values
22. Myntra Bag Exercise
23. Naming Conventions
24. Ways to create Variables

# 19. What are Variables?

Variable is used to Store Data

Variables are like containers  
used for storing data values.

# 20. Syntax Rules

```
1 // Defining a number variable  
2 let noOfStudents = 5;  
3 // Defining a String variable  
4 let welcomeMessage = "Hello Beta"
```

1. Can't use **keywords** or reserved words
2. Can't start with a **number**
3. No special characters other than **\$** and **\_**
4. **=** is for **assignment**
5. **:** means end of **instruction**

# 21. Updating Values

```
let noOfStudents = 5;  
noOfStudents = noOfStudents + 1;
```

```
let money = 1;  
money += 5; // money = 6  
money -= 2; // money = 4  
money *= 3; // money = 12  
money /= 4; // money = 3  
money++; // money = 4
```

1. Do not need to use **let** again.
2. Syntax: **variable = variable + 1**
3. Assignment Operator is used **=**
4. Short Hand Assignment Operators:  
**+ =, - =, \* =, / =, ++**

# 22. Myntra Bag Exercise

Add to Bag

MOVE TO WISHLIST

Add 1+1 sale item

Your Bag has 2 items

r

# 23. Naming Conventions

## camelCase

- Start with a lowercase letter. Capitalize the first letter of each subsequent word.
- Example: `myVariableName`

## snake\_case

- Start with an lowercase letter. Separate words with underscore.
- Example: `my_variable_name`

## Kebab-case

- All lowercase letters. Separate words with hyphens. Used for HTML and CSS.
- Example: `my-variable-name`

## Keep a Good and Short Name

- Choose names that are descriptive but not too long. It should make it easy to understand the variable's purpose.
- Example: `age`, `firstName`, `isMarried`

# 24. Ways to Create Variables

var

var apple = 

a thing in a box  
named "apple"

apple = 

you can swap  
item later

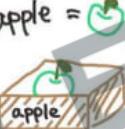

let

let apple = 

a thing in a box  
named "apple" w/  
protection shield

apple =  NG

OK! you can swap item  
only if you ask  
inside of the shield

const

const apple = 

a thing in  
LOCKED cage  
named "apple"

apple =  NG

you can't  
swap item  
later.

apple.multiply(3) 

... but you can ask  
the item to change itself  
(if the item has method  
to do that)

const

let

var

# Variables Revision

- 19. What are Variables
- 20. Syntax Rules
- 21. Updating Values
- 22. Myntra Bag Exercise
- 23. Naming Conventions
- 24. Ways to create Variables

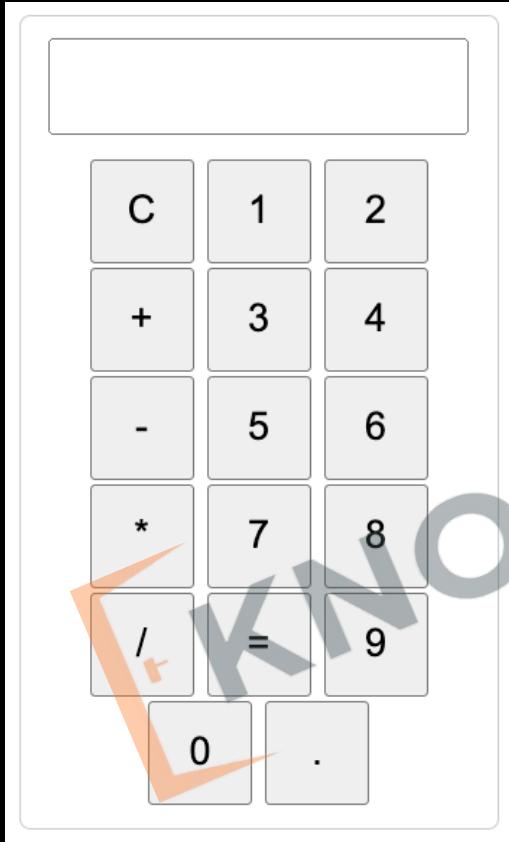

# Practice Exercise

## Variables

1. Save your name in a variable inside script tag
2. Display name from the variable on the page
3. Calculate the cost of Myntra Bag and keep it in a variable
4. Show it to console
5. Keep GST percentage as constant
6. Use eval method from math to convert string calculation into result

# Project One: Calculator

# if-else & Boolean

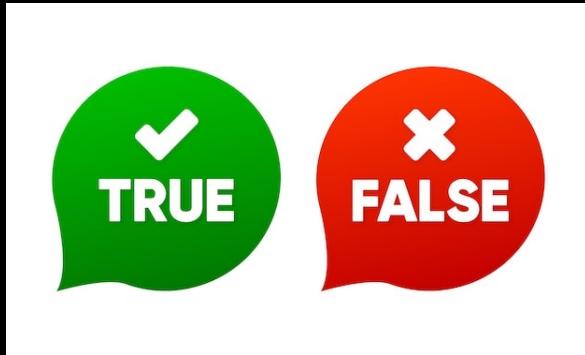

- 25. What are Booleans
- 26. Comparison Operators
- 27. if-else
- 28. Logical Operator
- 29. Scope
- 30. Truthy and Falsy Values
- 31. If alternates

Create

Project

# 25. What are Booleans?

1. Data Type: Booleans are a basic data type in JavaScript.
2. Two Values: Can only be true or false.
3. 'true' is a String not a Boolean

# 26. Comparison Operators

<, >, <=, >=, ==, !=

## Equality

`==` Checks value equality.

`===` Checks value and type equality.

## Inequality

`!=` Checks value inequality.

`!==` Checks value and type inequality.

## Relational

`>` Greater than.

`<` Less than.

`>=` Greater than or equal to.

`<=` Less than or equal to.

Order of comparison operators is less than arithmetic operators

# 27. if-else

1. Syntax: Uses `if () {}` to check a condition.
2. What is `if`: Executes block if condition is `true`, skips if `false`.
3. What is `else`: Executes a block when the if condition is `false`.
4. Curly Braces can be omitted for single statements, but not recommended.
5. If-else Ladder: Multiple if and else if blocks; only one executes.
6. Use Variables: Can store conditions in variables for use in if statements.

# Project Cricket Game

*Defeats*

*Defeats*

*Defeats*

## Bat Ball Stump Game

Bat

Ball

Stump

# 28. Logical Operators

AND

Or

not

1. Types: **&&** (AND), **||** (OR), **!** (NOT)
2. AND (**&&**): All conditions **must be true** for the result to be true.
3. OR (**||**): Only **one condition** must be true for the result to be true.
4. NOT (**!**): **Inverts** the Boolean value of a condition.
5. Lower Priority than **Math** and **Comparison** operators

# Project Cricket Game

*Defeats*

*Defeats*

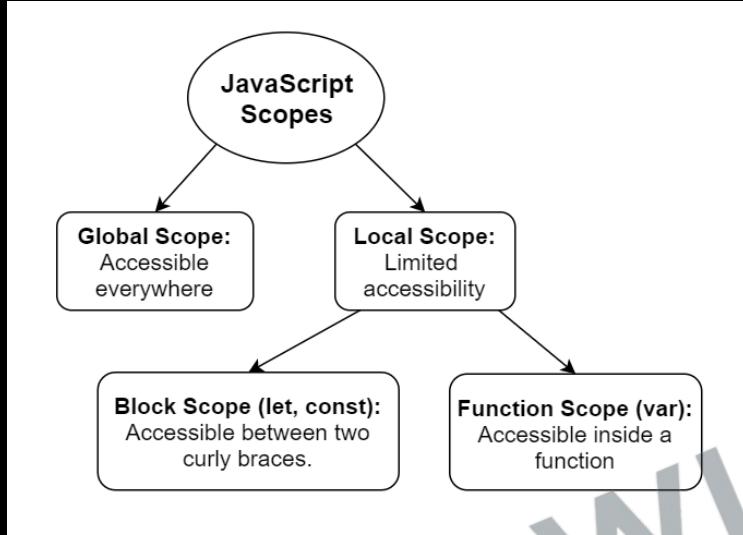

*Defeats*

**KNOWLEDGE GATE**

# 29. Scope

1. Any **variable** created inside `{}` will remain inside `{}`
2. Variable can be **redefined** inside `{}`
3. **Var** does **not** follow **scope**
4. Global Scope: Accessible **everywhere** in the code.
5. Block Scope: **Limited** to a block, mainly with **let** and **const**.
6. Declare variables in the **narrowest** scope possible.

# Project Cricket Game

*Defeats*

*Defeats*

*Defeats*

**KNOWLEDGE GATE**

# 30. Truthy and Falsy Values

1. Falsy Values: 0, null, undefined, false, NaN, "" (empty string)
2. Truthy Values: All values **not** listed as falsy.
3. Used in **conditional** statements like **if**.
4. **Non-boolean** values are **auto-converted** in logical operations.
5. Be **explicit** in **comparisons** to avoid unexpected behaviour.

# 31. If alternates

1. Ternary Operator: `condition ? trueValue : falseValue`

Quick one-line if-else.

2. Guard Operator: `value || defaultValue`

Use when a `fallback` value is needed.

3. Default Operator: `value ?? fallbackValue`

Use when you want to consider only null and undefined as falsy.

4. Simplifies conditional logic.

5. Use wisely to maintain readability.

# if-else & Boolean Revision

- 25. What are Booleans
- 26. Comparison Operators
- 27. if-else
- 28. Logical Operator
- 29. Scope
- 30. Truthy and Falsy Values
- 31. If alternates

# Practice Exercise

if-else & Boolean

1. Give discount based on age, gender for metro ticket

- Females get 50% off
- Kids under 5 years of age are free
- Kids up to 8 years have half ticket
- People Over 65 years of age only pay 30% of the ticket
- In case of multiple discounts max discount will apply.

# Functions

- 32. What are Functions
- 33. Function Syntax
- 34. Return statement
- 35. Function Parameters

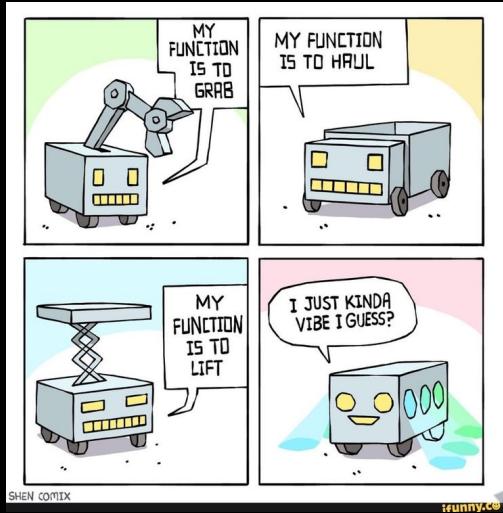

Improve

Project

KNOWLEDGE GATE'

# 32. What are Functions?

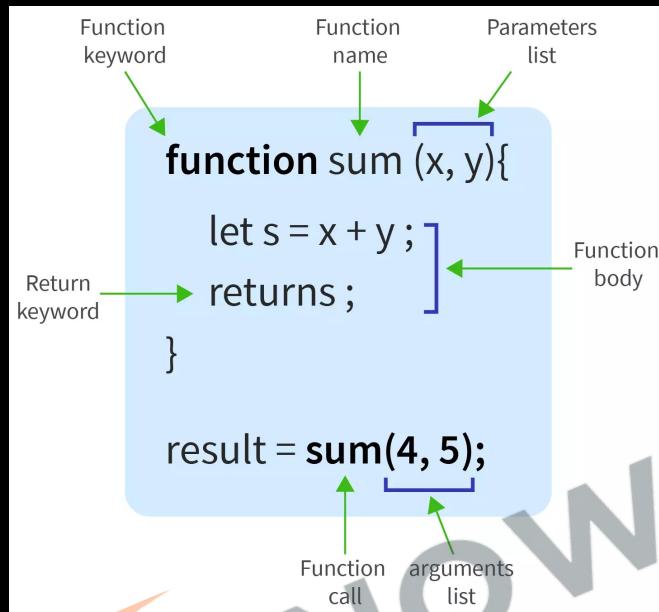

```
function greet(name) {  
    // code  
}  
  
greet(name);  
// code
```

A diagram illustrating a function call. A blue bracket on the left encloses the entire function definition (the first two lines). A blue bracket on the right encloses the function call (the third line). An arrow points from the word "call" to the closing parenthesis of the function call.

1. Definition: Blocks of **reusable** code.
2. DRY Principle: "**Don't Repeat Yourself**" it Encourages code reusability.
3. Usage: Organizes **code** and performs specific tasks.
4. Naming Rules: Same as **variable** names: **camelCase**
5. Example: "Beta Gas band kar de"

# 33. Functions Syntax

1. Use **function keyword** to declare.
2. Follows same rules as **variable names**.
3. Use **()** to contain parameters.
4. Invoke by using the **function name** followed by **()**.
5. Fundamental for **code organization** and **reusability**.

# Project Cricket Game

*Defeats*

*Defeats*

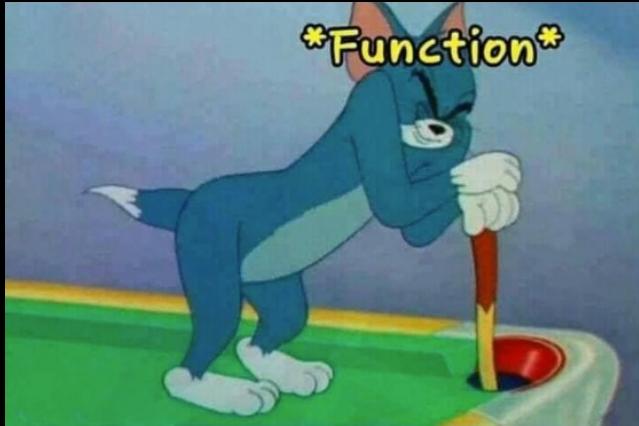

*Defeats*

Create Method for Random Number & Computer Choice

# 34. Return statement

1. Sends a value back from a function.
2. Example: "Ek glass paani laao"
3. What Can Be Returned: Value, variable, calculation, etc.
4. Return ends the function immediately.
5. Function calls make code jump around.
6. Prefer returning values over using global variables.

# Project Cricket Game

*Defeats*

*Defeats*

*Defeats*

User return instead of Global Variable

# 35. Parameters

1. Input values that a **function** takes.
2. Parameters put value into function, while return gets value out.
3. Example: "Ek packet dahi laao"
4. Naming Convention: Same as **variable** names.
5. **Parameter vs Argument**
6. Examples: **alert**, **Math.round**, **console.log** are functions we have already used
7. **Multiple Parameters:** Functions can take **more than one**.
8. **Default Value:** Can set a **default** value for a parameter.

# Project Cricket Game

*Defeats*

Create method for comparing user choice & Showing  
Result alert

*Defeats*

*Defeats*

# Functions Revision

- 32. What are Functions
- 33. Function Syntax
- 34. Return statement
- 35. Function Parameters

# Practice Exercise

## Functions

1. Create a method to check if a number is odd or even.
2. Create a method to return larger of the two numbers.
3. Create Method to convert Celsius to Fahrenheit  
 $F = (9/5) * C + 32$

# Objects

36. What is an Object
37. Objects Syntax
38. Accessing Objects
39. Inside Objects
40. Autoboxing
41. Object References
42. Object Shortcuts

Maintain score of

Project

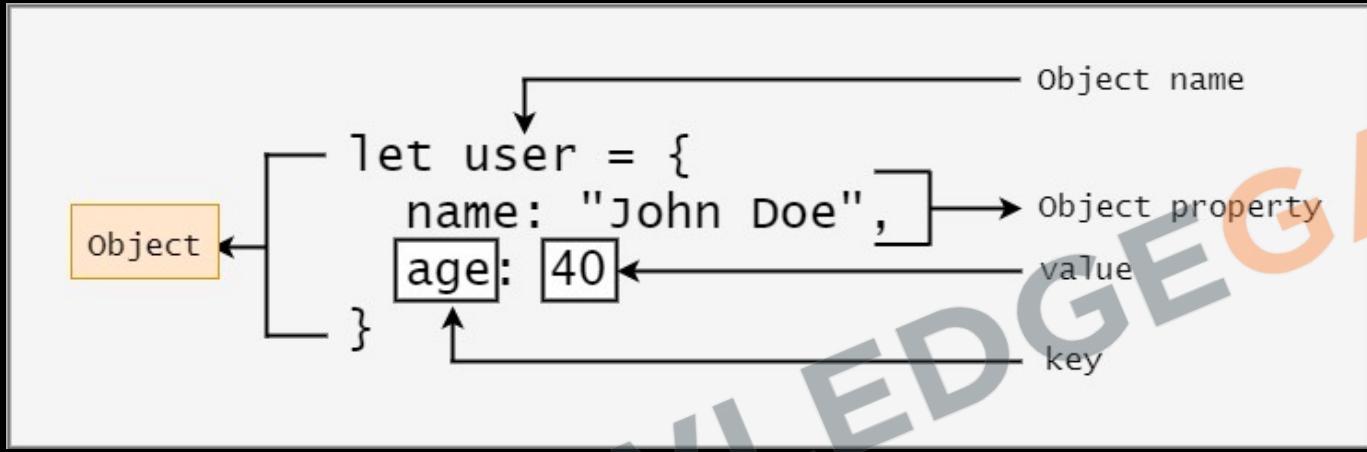

# 36. What is an Object?

```
let product = {  
    company: 'Mango',  
    item_name: 'Cotton striped t-shirt',  
    price: 861  
};
```

1. Groups multiple **values** together in **key-value** pairs.
2. How to Define: Use **{}** to enclose **properties**.
3. Example: product **{name, price}**
4. Dot Notation: Use **. operator** to access values.
5. Key Benefit: Organizes **related data** under a **single name**.

# 37. Object Syntax?

1. Basic Structure: Uses {} to enclose data.
2. Rules: Property and value separated by a colon(:)
3. Comma: Separates different property-value pairs.
4. Example: { name: "Laptop", price: 1000 }

# 38. Accessing Objects

1. Dot Notation: Access **properties** using **.** Operator like `product.price`
2. Bracket Notation: Useful for **properties** with **special characters** `product["nick-name"]`. Variables can be used to access properties
3. **typeof** returns **object**.
4. Values can be **added** or **removed** to an object
5. Delete Values using **delete**

# Project Cricket Game

*Defeats*

Create object for maintaining Score

*Defeats*

*Defeats*

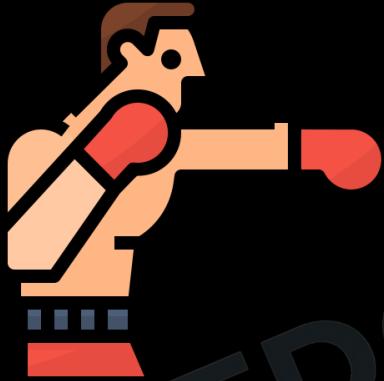

# 39. Inside Object

```
let product = {  
    company: 'Mango',  
    itemName: 'Cotton striped t-shirt',  
    price: 861,  
    rating: {  
        stars: 4.5,  
        noOfReviews: 87  
    },  
    displayPrice: function() {  
        return `$$ {this.price.toFixed(2)} `;  
    }  
};
```

1. Objects can contain **Primitives** like **numbers** and **strings**.
2. Objects can contain **other objects** and are called Nested Objects.
3. **Functions** can be object properties.
4. Functions inside an object are called **methods**.
5. Null Value: **Intentionally** leaving a property **empty**.

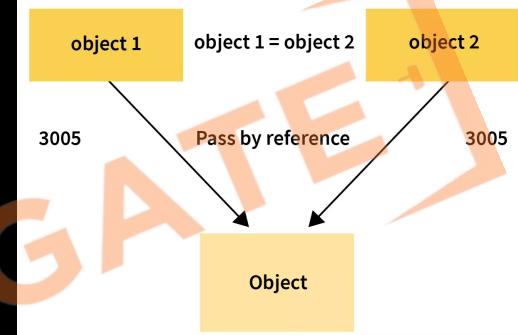

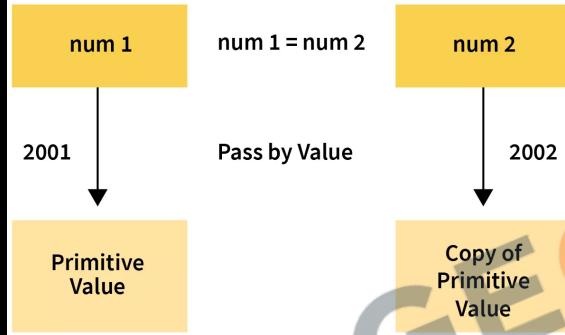

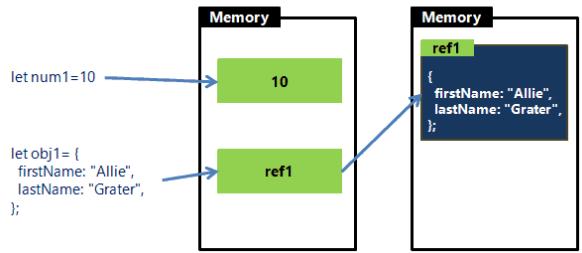

# 40. Autoboxing

1. Automatic conversion of primitives to objects.
2. Allows properties and methods to be used on primitives.
3. Example: Strings have properties and methods like length, toUpperCase, etc.

# 41. Object References

## How Value Types & Reference Types are stored

1. Objects work based on **references**, not actual data.
2. Copying an object copies the **reference**, not the actual object.
3. When comparing with **`==`**, you're comparing references, not content.
4. Changes to one reference **affects all copies**.

# 42. Object Shortcuts

```
let product = {  
    company: 'Mango',  
    itemName: 'Cotton striped t-shirt',  
    price: 861  
};  
  
// Destructuring  
let company = product.company  
// is same as  
let { company } = product;
```

```
// Property shorthand  
let price = 861;  
let product = {  
    company: 'Mango',  
    itemName: 'Cotton striped t-shirt',  
    price: price  
};  
  
// is same as  
let product1 = {  
    company: 'Mango',  
    itemName: 'Cotton striped t-shirt',  
    price  
};
```

```
// Method shorthand  
let product = {  
    company: 'Mango',  
    itemName: 'Cotton striped t-shirt',  
    displayPrice: function() {  
        return `${this.price.toFixed(2)}`;  
    }  
};  
  
// is same as  
let product1 = {  
    company: 'Mango',  
    itemName: 'Cotton striped t-shirt',  
    displayPrice() {  
        return `${this.price.toFixed(2)}`;  
    }  
};
```

1. De-structuring: Extract properties from objects easily.
2. We can extract more than one property at once.
3. Shorthand Property: {message: message} simplifies to just message.
4. Shorthand Method: Define methods directly inside the object without the function keyword.

# Project Cricket Game

*Defeats*

Move method for showing result into score  
Object.

*Defeats*

*Defeats*

# Objects Revision

- 36. What is an Object
- 37. Objects Syntax
- 38. Accessing Objects
- 39. Inside Objects
- 40. Autoboxing
- 41. Object References
- 42. Object Shortcuts

# Practice Exercise

## Objects

1. Create **object** to represent a **product** from **Myntra**
2. Create an **Object** with **two references** and log changes to one object by **changing** the other one.
3. Use bracket notation to display **delivery-time**.
4. Given an object `{message: 'good job', status: 'complete'}`, use de-structuring to create two variables **message** and **status**.
5. Add **function** `isIdenticalProduct` to compare two product objects.

# JSON, Local Storage, Date & DOM

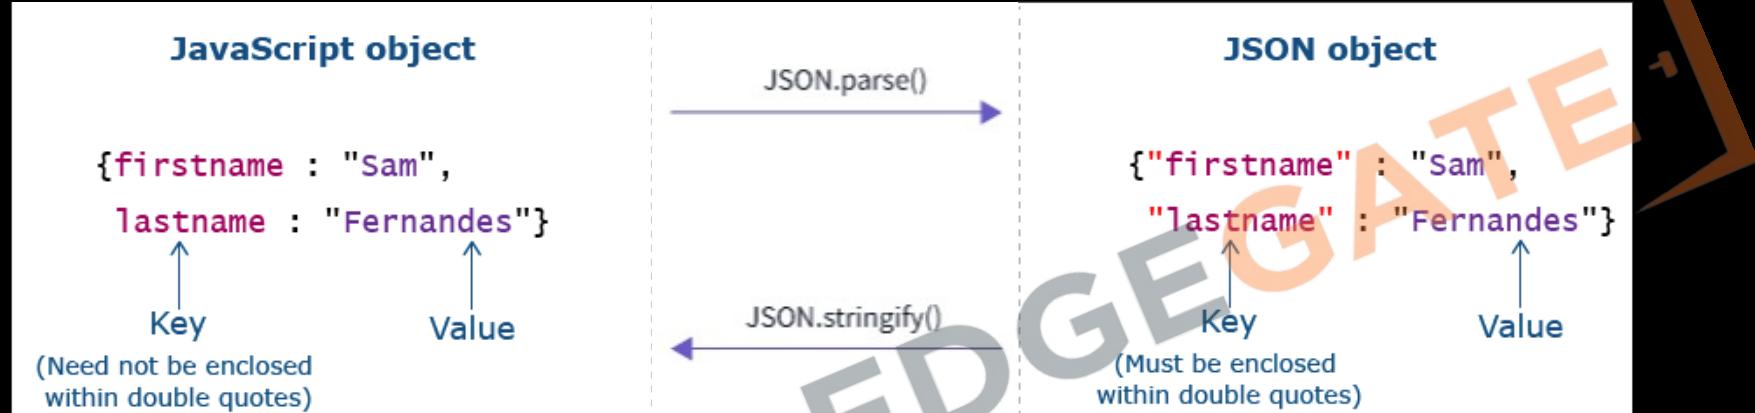

- 43. What is JSON?
- 44. Local Storage
- 45. Date
- 46. DOM Properties & Methods

Finish

Project

# 43. What is JSON?

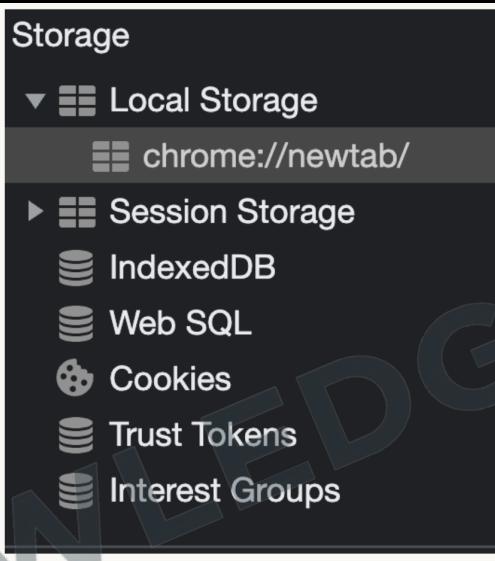

1. JavaScript Object Notation: Not the same as JS object, but similar.
2. Common in network calls and data storage.
3. `JSON.stringify()` and `JSON.parse()`
4. Strings are easy to transport over network.
5. JSON requires double quotes. Escaped as \".
6. JSON is data format, JS object is a data structure.

# 44. Local Storage

```
// store an object in Local Storage
localStorage.setItem(
  "user",
  JSON.stringify({
    name: "Gopi Gorantala"
    age: 32
  });
);

// retrieve an object in Local Storage
const user = JSON.parse(
  localStorage.getItem("user")
);
```

1. Persistent data storage in the browser.
2. `setItem`: Stores data as key-value pairs.
3. Only strings can be stored.
4. `getItem`: Retrieves data based on key.
5. Other Methods: `localStorage.clear()`, `removeItem()`.
6. Do not store sensitive information. Viewable in storage console.

# Project Cricket Game

*Defeats*

1. Score will survive browser refresh.
2. Add Reset Button To clear or reset stored data.

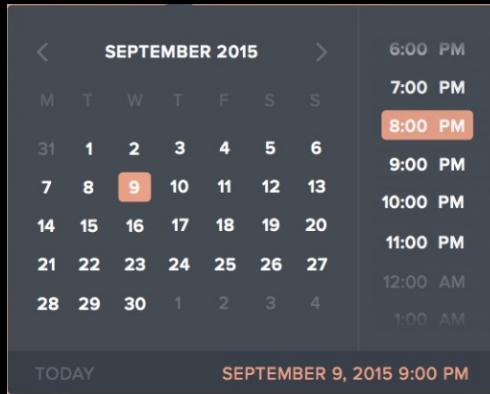

*Defeats*

*Defeats*

# 45. Date

1. `new Date()` Creates a `new Date` object with the `current` date and time.
2. Key Methods:
  - `getTime()`: Milliseconds since Epoch.
  - `getFullYear()`: 4-digit year
  - `getDay()`: Day of the week
  - `getMinutes()`: Current minute
  - `getHours()`: Current hour.
3. Crucial for `timestamps`, `scheduling`, etc.

# 46. DOM Properties & Methods

## DOM and Element Properties

- 1. location
- 2. title
- 3. href
- 4. domain
- 5. innerHTML
- 6. innerText
- 7. classList

## DOM and Element Methods

- 1. getElementById()
- 2. querySelector()
- 3. classList: add(), remove()
- 4. createElement()
- 5. appendChild()
- 6. removeChild()
- 7. replaceChild()

# Project Cricket Game

*Defeats*

1. Show moves in the page instead of the alert
2. Show result in the page instead of the alert

*Defeats*

*Defeats*

# Project Cricket Game

Defeats

1. Replace the Bat-Ball-Stump Buttons with Images

Defeats

Defeats

# JSON, Local Storage, Date & DOM

## Revision

- 43. What is JSON?
- 44. Local Storage
- 45. Date
- 46. DOM Properties & Methods

# Practice Exercise

## JSON ,Local Storage, Date & DOM

1. Display good morning, afternoon and night based on current hour.
2. Add the name to the output too.
3. Create a Button which shows the number how many times it has been pressed.
  - Also, it has different colors for when it has been pressed odd or even times.
  - The click count should also survive browser refresh.

# Arrays & Loops

- 47. What is an Array?
- 48. Array Syntax & Values
- 49. Array Properties & Methods
- 50. What is a Loop?
- 51. While Loop
- 52. Do While Loop
- 53. For Loop
- 54. Accumulator Pattern
- 55. Break & Continue

# 47. What is an Array?

1. An Array is just a **list** of values.
2. Index: Starts with **0**.
3. Arrays are used for **storing multiple values** in a single variable.

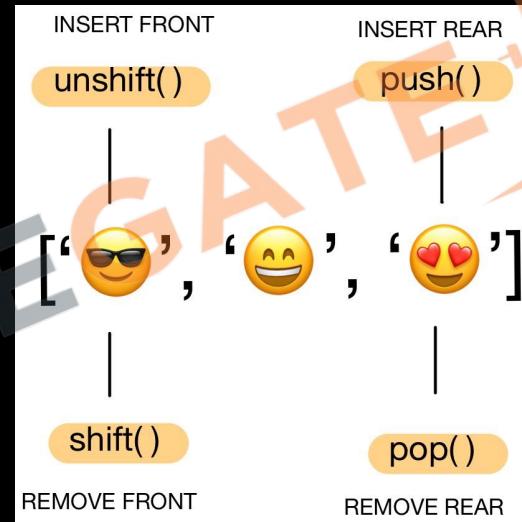

# 48. Array Syntax & Values

```
let myArray = [1, 'KG Coding', null, true,  
  {likes: '1 Million'}];
```

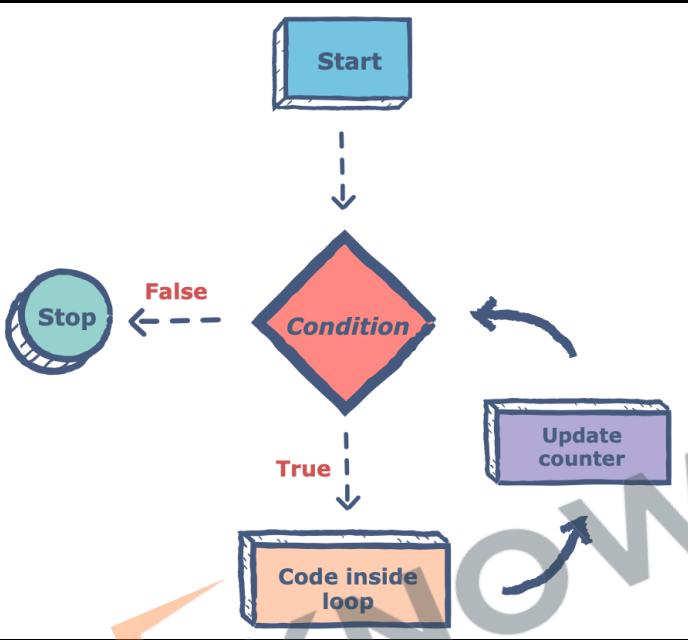

1. Use [] to create a new array, [] brackets enclose list of values
2. Arrays can be saved to a variable.
3. Accessing Values: Use [] with index.
4. Syntax Rules:
  - Brackets start and end the array.
  - Values separated by commas.
  - Can span multiple lines.
5. Arrays can hold any value, including arrays.
6. typeof operator on Array Returns Object.

# 49. Array Properties & Methods

1. `Array.isArray()` checks if a variable is an array.
2. `Length` property holds the size of the array.
3. Common Methods:
  - `push/pop`: Add or remove to end.
  - `shift/unshift`: Add or remove from front.
  - `splice`: Add or remove elements.
  - `toString`: Convert to string.
  - `sort`: Sort elements.
  - `valueOf`: Get array itself.
4. Arrays also use `reference` like objects.
5. De-structuring also works for Arrays.

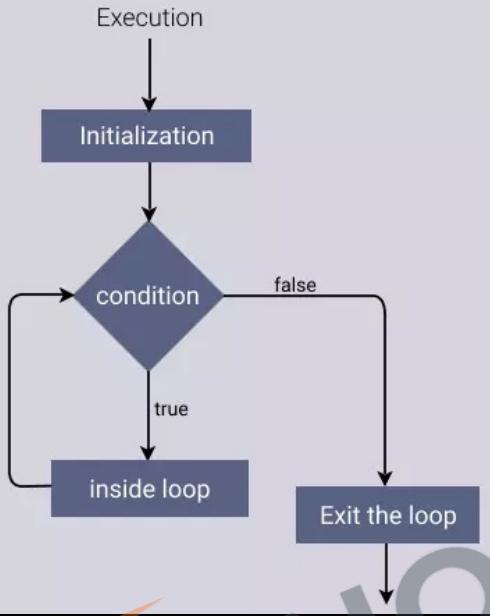

# 50. What is a Loop?

1. Code that runs multiple times based on a condition.
2. Loops also alter the flow of execution, similar to functions.
  - Functions: Reusable blocks of code.
  - Loops: Repeated execution of code.
3. Loops automate repetitive tasks.
4. Types of Loops: for, while, do-while.
5. Iterations: Number of times the loop runs.

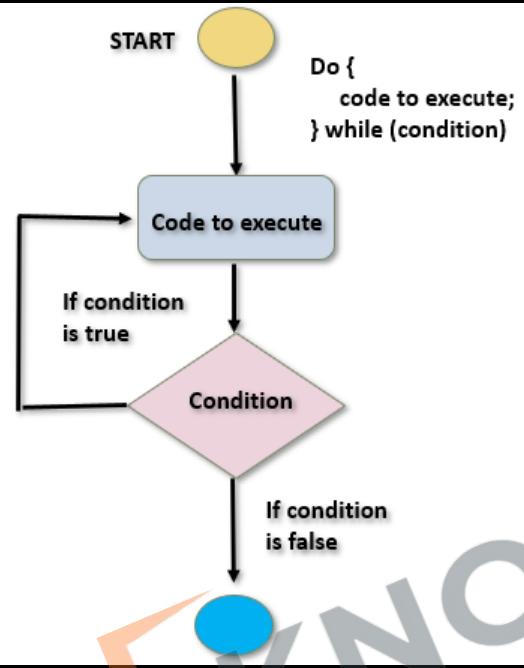

# 51. While Loop

```
while (condition) {  
    // Body of the loop  
}
```

1. Iterations: Number of **times** the loop **runs**.
2. Used for **non-standard** conditions.
3. Repeating a block of code **while** a condition is **true**.
4. Remember: Always include an update to **avoid infinite loops**.

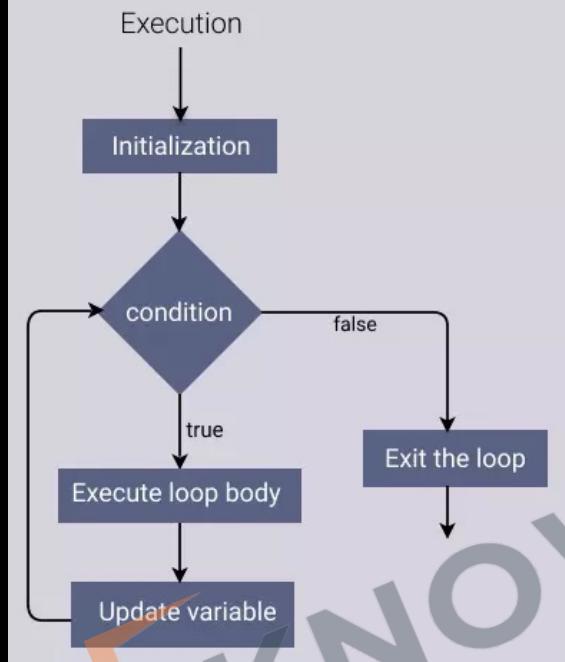

# 52. Do While Loop

```
do {  
    // Body of the loop  
}  
while (condition);
```

1. Executes block **first**, then checks condition.
2. Guaranteed to run **at least one** iteration.
3. Unlike while, first iteration is **unconditional**.
4. Don't forget to update condition to **avoid infinite loops**.

# 53. For Loop

```
for (initialisation; condition; update) {  
    // Body of the loop  
}
```

1. Standard loop for running code multiple times.
2. Generally preferred for counting iterations.

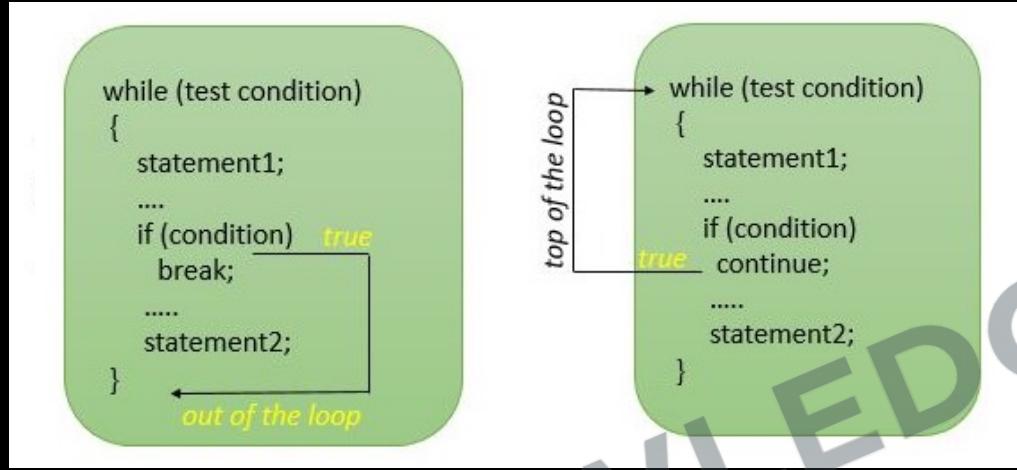

# 54. Accumulator Pattern

**ACCUMULATE**

1. A pattern to **accumulate values** through looping.
2. Common Scenarios:
  - Sum all the numbers in an array.
  - Create a **modified copy** of an array.

# 55. Break & Continue

1. Break lets you stop a loop early, or break out of a loop
2. Continue is used to skip one iteration or the current iteration
3. In while loop remember to do the increment manually before using continue

# Arrays & Loops

## Revision

47. What is an Array?
48. Array Syntax & Values
49. Array Properties & Methods
50. What is a Loop?
51. While Loop
52. Do While Loop
53. For Loop
54. Accumulator Pattern
55. Break & Continue

# Practice Exercise

## Arrays & Loops

1. Create an array of numbers [5,6]. Add 4 at the beginning and 7 at the end of the array.
2. Create a method to return an element at a particular position in the array.
3. Create an array copy using slice method.
4. Create a while loop that exits after counting 5 prime numbers.
5. Modify the above loop to finish using break.
6. Create a for loop that prints number 1 to 10 in reverse order.
7. Using continue only print positive numbers from the given array [1,-6,5,7,-98]
8. Using accumulator pattern concatenate all the strings in the given array ['KG', 'Coding', 'Javascript', 'Course', 'is', 'Best']

# Advance Functions

- 56. Anonymous Functions As Values
- 57. Arrow functions
- 58. setTimeout & setInterval
- 59. Event Listener
- 60. For Each Loop
- 61. Array methods

# 56. Anonymous Functions As Values

```
let sum = function(num1, num2) {  
    return num1 + num2;  
}
```

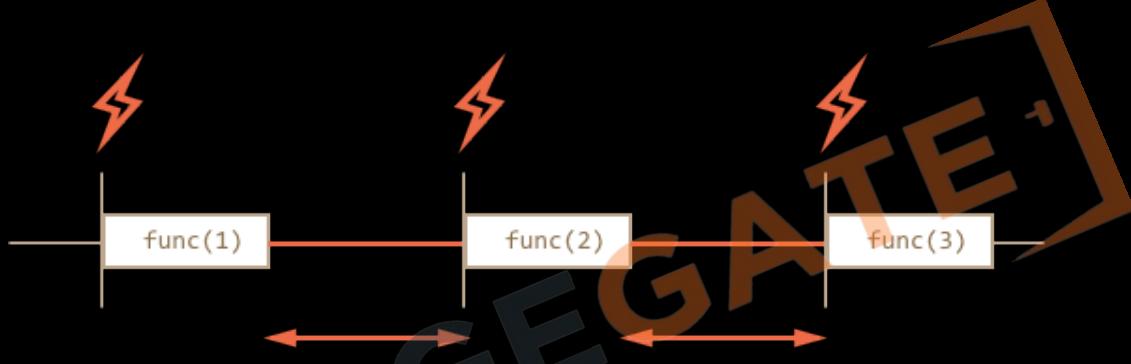

1. Functions in JavaScript are first-class citizens; they can be assigned to variables.
2. Functions defined without a name, often assigned to a variable.
3. Anonymous functions can be properties in objects
4. Can be passed as arguments to other functions.
5. Invoked using () after the function name or variable.
6. `console.log(myFunction);` and `typeof myFunction` will both indicate it's a function.

# 57. Arrow Functions

```
let sum = function(num1, num2) {  
    return num1 + num2;  
}  
  
let Sum1 = (num1, num2) => {  
    return num1 + num2;  
}  
  
let Sum2 = (num1, num2) => num1 + num2;  
let square = num => num * num;
```

1. A concise way to write **anonymous** functions.
2. For Single Argument: Round brackets **optional**.
3. For Single Line: Curly brackets and return **optional**.
4. Often used when passing **functions as arguments**.

# 58. setTimeout & setInterval

1. Functions for executing code **asynchronously** after a delay.
2. `setTimeout` runs **once**; `setInterval` runs **repeatedly**
3. `setTimeout`:
  - Syntax: `setTimeout(function, time)`
  - Cancel: `clearTimeout(timerID)`
4. `setInterval`:
  - Syntax: `setInterval(function, time)`
  - Cancel: `clearInterval(intervalID)`

# 59. Event Listener

```
const button = document.querySelector(".btn")
button.addEventListener("click", event => {
  console.log("Hello!");
})
```

1. What Is an Event: Occurrences like **clicks**, **mouse movement**, **keyboard input** (e.g., birthday, functions).
2. Using **querySelector** to attach listeners.
3. Multiple Listeners: You can add **more than one**.
4. **removeEventListener('event', functionVariable);**

# 60. For Each Loop

```
let foods = ['bread', 'rice', 'meat', 'pizza'];

foods.forEach(function(food) {
    console.log(food);
})
```

1. A method for array iteration, often preferred for readability.
2. Parameters: One for item, optional second for index.
3. Using return is similar to continue in traditional loops.
4. Not straightforward to break out of a forEach loop.
5. When you need to perform an action on each array element and don't need to break early.

# 61. Array Methods

```
[不断增强] [不断增强] [不断增强]  
[🍔, 🍠, 🐔, 🥬].map(cook) => [🍔, 🍟, 🍗, 🍟]  
[🍔, 🍟, 🍗, 🍟].filter(isVegetarian) => [🍟, 🍟]
```

1. Filter Method:
  - Syntax: `array.filter((value, index) => return true/false)`
  - Use: Filters elements based on condition.
2. Map Method:
  - Syntax: `array.map((value) => return newValue)`
  - Use: Transforms each element.

# Advance Functions Revision

- 56. Anonymous Functions As Values
- 57. Arrow functions
- 58. setTimeout & setInterval
- 59. Event Listener
- 60. For Each Loop
- 61. Array methods

# Practice Exercise

## Advance Functions

1. Create a variable `multiply` and assign a `function` to this variable that `multiplies two numbers`. Call this method from the variable.
2. Create a function `runTwice` that takes a function as a parameter and then `runs that method` twice.
3. Create a button which should `grow double in size` on clicking after `2 seconds`.
4. In the `above exercise` add the behavior using an `event listener` instead of `onclick`.
5. Create a function that `sums` an array of numbers. Do this using a `for-each` loop.
6. Create a function that takes an `array of numbers` and return their `squares` using `map` function.
